LETTER OF TRANSMITTAL.

DEPARTMENT OF COMMERCE,
BUREAU OF THE CENSUS,
Washington, D. C., June 1, 1918.

SIR:

I transmit herewith a report on prisoners and juvenile delinquents, which is essentially a study and analysis of statistics compiled in connection with the census of 1910. This report, it should be noted, however, is not the first or earliest publication of the data obtained through that census, as the basic figures were given to the public in the form of statistical tables contained in a bulletin issued in 1913 and reproduced in the present report. But it was considered that the subject was of such interest and importance as to justify a critical study of the results made with a view to bringing out the significance of the figures by means of analytical tables and text. At the same time the report presents the data in fuller detail than was the case in the earlier publication.

This report was prepared in the Division of Revision and Results under the supervision of Dr. Joseph A. Hill, expert special agent, assisted by Mr. Reginald L. Brown.

Respectfully,

SAM. L. ROGERS,
Director of the Census.

Hon. WILLIAM C. REDFIELD,
Secretary of Commerce.

PRISONERS AND JUVENILE DELINQUENTS IN THE UNITED STATES

1910

PRISONERS AND JUVENILE DELINQUENTS.

By Joseph A. Hill, Expert Special Agent.

INTRODUCTION.

SCOPE OF THE CENSUS.

The census of prisoners and juvenile delinquents which was taken in the year 1910 included all persons serving a sentence for any crime or misdemeanor in any penal or reformatory institution on January 1, 1910, and all persons committed under sentence to such institutions during the year. The total number of institutions canvassed was 3,271, including 3 Federal penitentiaries, 58 state prisons or penitentiaries, 20 reformatories for adults or for adults and juveniles, 100 reformatories for juveniles exclusively, 2,502 county jails, workhouses, or similar institutions, and 588 municipal jails or workhouses. The total number of prisoners and juvenile delinquents enumerated on January 1, 1910, was 136,472, and the total number committed during the year 1910 was 493,934. It should be explained that in accordance with the usage established at prior censuses the term "juvenile delinquents" as used in this report distinguishes the inmates of reformatories exclusively for juveniles, the term "prisoners" including without regard to age the inmates of all other penal or reformatory institutions. The 136,472 prisoners and juvenile delinquents enumerated on January 1, 1910, included 111,498 prisoners as thus defined and 24,974 juvenile delinquents; and the 493,934 commitments reported during the year included 479,787 prisoners and 14,147 juvenile delinquents.

The data collected by the census comprised in the case of prisoners sex, age, race, nativity, marital condition, illiteracy, occupation before commitment, offense of which convicted, and sentence; in the case of juvenile delinquents the items were substantially the same with the omission of the inquiries as to marital condition and occupation. Generally in the various chapters of this report the statistics for the two classes are either presented side by side in the same connection or are combined in one total. This is a departure from the practice at prior censuses, at which the statistics for juvenile delinquents were presented in a separate section of the report, and were nowhere brought into relation with those for prisoners of the same age. It should be noted in this connection, however, that the present report includes a section presenting separately the statistics for all offenders or delinquents under 18 years of age, including those in prisons and jails as well as those in reformatories.

SIGNIFICANCE OF THE DATA.

Sentenced prisoners are offenders against society who have been placed under confinement or restraint for purposes of punishment or reformation or for public safety; at the same time they are public charges who must be supported at public expense and for whose care and well-being society is responsible. From either point of view the information obtained through a census of the prison population showing the numbers and characteristics of this class, and covering such facts as sex, age, race, nativity, illiteracy, offense, and sentence possesses a high degree of interest. Considered, however, as an index of the occurrence of crime or of the prevalence of criminality in the community, the value of such a census may be overrated. That this was formerly the case is implied by the fact that the earlier census reports published the statistics of prisoners under the title "statistics of crime." Of course, it is true that each sentenced prisoner represents a crime or offense that has been committed. But it is hardly possible to deduce from the number of such prisoners in confinement on a given day any conclusions regarding the number of crimes committed within any given period of time in the community from which the prisoners are gathered, not merely because many crimes are committed for which no one is ever imprisoned, but because the size and composition of the prison population are affected not alone by the number of convictions but also by the length of the terms of imprisonment imposed as penalties. An increase in the prison population will result from an increase in the average length of sentence just as certainly as from an increase in the number of persons sentenced. Therefore, it can not be assumed that the prison population in different communities or at different periods varies directly according to the number of offenses committed or that differences as regards the ratio of prison inmates to general population represent corresponding differences in the relative number of persons convicted and imprisoned within any given period.

Moreover, the very wide diversity in the length of the sentences imposed for different offenses results in a similar diversity in the period covered by the offenses committed by the different classes of prisoners in confinement on any given date. As regards the more serious offenses, which are punishable by

long terms of imprisonment, the prison population represents the accumulation of a period of years, while as regards minor offenses the period covered is only a few weeks or months. Thus the offenses committed by the prison inmates considered as a group relate to no definite period of time; and any classification of prison population according to offense gives an exaggerated impression of the relative frequency of the offenses punishable by long-term imprisonment. As regards capital offenses, on the other hand, the number in prison on a given date includes as a rule only those recently committed, since ordinarily a person sentenced to capital punishment remains in prison only a short time, pending the execution of the sentence. It is evident, then, that from a mere census of prison population no very definite conclusion regarding the prevalence of criminality or the occurrence of crime can be drawn.

A better index of criminality, however, is afforded by a record of prison commitments, because the statistics obtained by such a record relate to events occurring within a definite period of time. Therefore, the extension of the scope of the census of prisoners in 1904 to include not only those in confinement on a given day, but also those committed during a given period, namely, one year, represents a distinct advance in the development of criminal statistics in the United States. As regards offenses which have been punished by imprisonment, the census now furnishes a record of the number so punished within one year. It also defines and classifies the annual influx of prisoners, thus indicating the extent to which different communities or classes are represented in the commission of those crimes and offenses which are followed by convictions and imprisonment. In short, while the statistics obtained by the census do not cover all crimes committed, they cover all that were punished by imprisonment within the period to which they relate.

Court records would afford a more complete inventory of crime than prison records, because they include all cases brought to trial. They cover cases in which it is proven that a crime has been committed, but the person accused is acquitted as not being the guilty party; and also cases in which the offender is convicted and punished by a fine, which cases are not included in an enumeration of prisoners committed except when the offender is imprisoned for nonpayment of fine. In a number of foreign countries statistics of criminality are regularly compiled on the basis of police and court records, but in the United States this field of statistical investigation has thus far been almost entirely neglected.

HISTORICAL REVIEW.

The earlier censuses.—Statistics in regard to prisoners were compiled in connection with each general population census of the United States from that of 1850 to that of 1890, inclusive. Practically all the data for the earlier censuses,[1] those of 1850, 1860, and 1870, were secured by means of a special schedule for "social statistics," which the United States assistant marshals, who were the census enumerators of those days, were directed to fill out for each city, town, or other civil subdivision within their districts.[2] This schedule covered a variety of topics, including valuation, taxation, schools, libraries, churches, pauperism, and wages. Under the heading of "Crime" it included in 1850 and 1860 questions as to the whole number of criminals convicted within the year and the number in prison on June 1, with a distinction of native and foreign in each case. In 1870 the question as to the number in prison was slightly elaborated so as to distinguish "native white" and "native black."

It may be noted that while the schedule called for an enumeration of "criminals," no definition of the term "criminal" appears in the published instructions relating to these censuses. Thus it was apparently left to the assistant marshal to follow his own definition or conception of the meaning of the term. Yet its connotation is by no means self-evident. Persons guilty only of minor offenses punishable by a few days' or weeks' imprisonment are not ordinarily thought of as criminals, although the term "crime" broadly applied would perhaps include all such offenses. Similarly there was a failure to explain the use of the term "prison," and there was uncertainty likewise regarding the class of convictions to be enumerated. The need of definition and standardization was indicated by a great disparity at the census of 1860 between the number of convictions reported from the state of Pennsylvania, 2,930, and the number reported from the state of New York, 58,067. Commenting on these figures, the writer of the text of the 1870 report, probably Francis A. Walker, said: "It would not even require the most casual acquaintance with the communities thus characterized or stigmatized to establish the certainty that such statements could not be true. Human nature, with its opportunities and its temptations, does not vary to that extent with two degrees of latitude." On investigation it was found that in the one state, Pennsylvania, the returns were restricted to convictions before courts of record, while in New York the convictions in police and justices' courts were also included, which explains the striking contrasts in the returns for the two states. Again it

[1] The "Statistical View" of 1850 published certain statistics regarding the inmates of state prisons, penitentiaries, and jails based on data derived from the population schedule, which contained a question inquiring whether the person enumerated was a convict; but no use appears to have been made of the population schedule as a source of information at the later censuses.

[2] In 1870 the social statistics in some states were obtained by deputy marshals appointed for that special purpose.

was found that in one state the returns "would be restricted to convictions for grave offenses, without reference to the character of the tribunal, while in a neighboring state convictions for the most petty offenses were equally considered." Thus the statistics obtained at these earlier censuses can not, as was truthfully said, be "regarded as possessing any high degree of statistical authority." Nevertheless, as they possess a certain degree of interest and possibly have some statistical value, the totals for the United States are here presented for whatever they may be worth.

Table 1

YEAR.	CENSUS OF CRIMINALS.			
	Number of convictions during year ending June 1.	Number in prison June 1.	Ratio per 100,000 population.	
			Convictions.	In prison.
1850	26,679	6,737	115.0	29.0
1860	98,836	19,086	314.3	60.7
1870	36,562	32,901	94.8	85.3

The ratios included in the above table have hardly any significance save as an indication of the lack of comparability in the data on which they are based. Of course, as regards the actual prevalence of crime there were no such astounding contrasts between the different years as these ratios taken at their face value would imply. The high ratio of convictions in 1860 is largely to be explained by the inclusion to a considerable extent or in many states of convictions in police and magistrates' courts, while in 1870 an effort was apparently made to restrict the returns to offenses which ordinarily come within the jurisdiction of courts of record.[1] The statistics of the number of prisoners are slightly more consistent, but one can not be certain that the increasing ratio may not reflect simply increasing completeness in the canvass, or an extension of the scope of the enumeration to include a larger proportion of the municipal and county jails.

Censuses of 1880 and 1890.—In 1880 a new method was followed in the compilation of data relative to prisoners. The census enumerators were provided with a special supplemental schedule on which to make individual returns for all inhabitants in prisons. There was no uncertainty as to the intended scope of the term "prisons," for according to the schedule it comprehended every "state penitentiary or prison, county penitentiary or jail, workhouse, house of correction, city prison, station house, lockup, or calaboose." The data obtained for each prisoner included those facts regarding age, nativity, etc., which were entered on the population schedule for every inhabitant of the United States, and the additional special information called for by the supplemental schedule, which covered reason for imprisonment, date of incarceration, alleged offense, and sentence.

The supplemental schedule carried certain additional questions which were to be asked of the chief executive officer of every prison regarding the persons who had been committed during the preceding year. These questions required not only a statement of the number of persons imprisoned during the year but their classification by sex, race, and nativity, with a distinction of those imprisoned under sentence from those held upon other grounds, as debtors, witnesses, insane, or persons held pending trial. None of the data called for by these questions, however, were ever tabulated and published, probably because of lack of time for the work;[2] but it is also probable that the returns in any event would have proved to be incomplete and unsatisfactory. Equally fruitless was the plan for obtaining at this census an abstract of the criminal docket of each court with facts regarding the history and disposition of each criminal case entered on the docket during the preceding year. Through what agencies this information was to be secured is not definitely indicated in the published records of the census; and possibly little more was done than to formulate and send out the schedules. At any rate no data were ever published.

This census included also an elaborate schedule which was to be filled out by municipal police departments and which in connection with other matters called for the number of arrests made during one year, with a classification according to the offense for which the arrest was made and also according to the disposition of the case. Some of the data obtained from this schedule were tabulated and published, including the total number of arrests without classification by offense or by disposition of the case. The returns as to number of houses entered, of homicides committed, and of incendiary fires were also tabulated and published, but were obviously very deficient.

It is thus evident that the plans for the census of 1880 had in view a very comprehensive and complete compilation of criminal statistics, covering not only the prison population on a given date but commitments to prisons in the course of one year, criminal cases tried or appearing on the court dockets, arrests in cities, and even the number of certain crimes committed whether resulting in arrests or not. But the

[1] "Owing to the fact that the constitution of courts of record in the several States varies greatly as to the crimes over which they have jurisdiction, it has not been found practicable to make this table [a table showing the number of persons convicted] strictly one of convictions for crimes by courts of record. The effort has been, however, to make the returns for each State an equivalent for those of every other. . ."—*Census report of 1870; Population*, p. 567.

[2] In the letter transmitting the census report of 1880 on Defective, Dependent, and Delinquent Classes, which included the statistics relative to crime, it is stated that the tables published do not represent the entire result of the investigation as projected. "A portion of the work, begun and partially finished, was in the end abandoned, owing to the closing of the Office."

only one of these lines of inquiry which was carried out to completion as planned and yielded results of value was the census of prison population. Of the other proposed investigations the only one which yielded any results whatever was that relating to police statistics and these, as previously noted, were incomplete and fragmentary.

The plans for the collection of criminal statistics at the next census, that of 1890, were less ambitious, being limited to a census of prison population, with the addition of a police schedule, which, however, was much less elaborate than the one used in 1880. The special data regarding prisoners were obtained as before through the agency of the general census enumerators and by the use of a supplemental schedule similar to the one used in 1880. In the large prisons, however, as well as in other large institutions, the census enumerator was usually an official or employee of the institution.

The later censuses.—The act providing for the Twelfth Census, or the census of 1900, included the collection of statistics of prisoners and juvenile delinquents in a list of statistical inquiries which were not to be taken up until the work on the main subjects of the census of 1900 had been completed. In making this departure from the established practice of former censuses, the object in view was to simplify and lighten the work involved in the comprehensive decennial census and expedite the publication of the main census reports by postponing all statistical inquiries for which the data could be obtained later through separate machinery and without a house to house canvass, such as was necessary in securing the general population data. Accordingly, the census of prisoners and juvenile delinquents, instead of being taken in 1900, the year of the general census of population, manufactures, and agriculture, was deferred until the year 1904. The postponement, although it may have contributed to the end in view, had, however, one attendant disadvantage which perhaps had not been foreseen or considered. This lay in the fact that it impaired in some degree the value of the population data as a basis for computing ratios designed to show relatively the extent to which the various elements or groups of the general population as defined in the classifications by age, sex, race, or nativity were represented in the prison population. Without the knowledge derived from such comparisons the data obtained by a census of prisoners lose much of their significance. When, however, a considerable interval elapses between the enumeration of prisoners and that of the general population, the ratios must be based either on an estimated population for the same date or on the enumerated population of the earlier date, and the use of either basis involves an element of error or uncertainty in the results. For this reason mainly the legislation providing for the next decennial census, that of 1910, directed that the enumeration of prisoners should be made in the same year as the population census, as had been the case prior to 1900.

The census of 1904 included not only the prisoners present on a given day—June 30, 1904—but also those committed during the year 1904. Thus it was both a census of prison population and a record of prison commitments. The data were obtained through the agency of specially appointed enumerators who were, as a rule, officials or employees of the prisons, jails, or other penal institutions. The prisoner census of 1910 was similar in scope and organization. It included the commitments during one year as well as the prisoners present on a given day, was taken through the agency of special enumerators, and was entirely distinct from the general census of population, although, for reasons already stated, it was taken in the same year. Two points of difference, however, between the census of 1910 and that of 1904 may be noted in this connection. Of these one relates to the scope of the census, the census of 1904 omitting prisoners not directly sentenced to imprisonment but imprisoned for the nonpayment of fine, while in 1910 this class of prisoners was included. The other point of difference relates to the method of obtaining the data. In 1904 the commitments were to be entered on sheet schedules giving the data for all commitments occurring during the year; but as these sheets could not of course be filled out completely and returned to the Census Bureau until after the end of the year, the prison or jail officials in many cases seem to have postponed or neglected this task, and in the end failed to make any satisfactory returns. In 1910 the plan was adopted of having an individual card filled out for each prisoner at or near the date of his commitment and forwarded to the Census Bureau at the end of the month. This plan came as near as was practicable to collecting the data by a process of registration. Continued indefinitely, instead of merely for a single year, it would place this statistical inquiry on the basis of registration statistics, which may be defined as statistics regarding recurring events of a particular class or type, continuously compiled from data obtained by a record of the event made at or near the time of its occurrence. In this particular instance the event which is made a matter of record and affords material for the statistics is the commitment of an individual to prison or jail under sentence on conviction of a crime or misdemeanor. Continuous registration would undoubtedly furnish the ideal basis for the compilation of statistics of this class, but thus far in the development of criminal statistics in the United States we have only reached the stage of intermittent registration or, to be exact, registration for one year in ten as regards one class of criminal statistics only, namely, those based on prison records.

PRISON POPULATION.

The prison population enumerated at each of the last four censuses is shown in the following statement:

1880.

Prisoners in confinement on June 1, 1880	58,609
In penitentiaries	30,659
In workhouses and houses of correction	7,865
In county jails	12,691
In city prisons, lockups, calabooses, station houses, etc.	1,666
At work singly or in gangs outside of prison walls	4,879
In military prisons	499
In hospitals for the insane	350

1890.

Prisoners in confinement on June 1, 1890	82,329
In state prisons and penitentiaries	45,233
In county jails	19,861
In city prisons	3,264
In workhouses and houses of correction	9,968
Leased prisoners	2,308
In military and naval prisons	794
In hospitals and asylums for the insane	901

1904.

Prisoners in confinement under sentence on June 30, 1904 [1]	81,772
In state prisons and state and county penitentiaries [2]	53,292
In reformatories for adults	7,261
In county jails and workhouses	18,544
In municipal prisons and workhouses	2,675

1910.

Prisoners in confinement under sentence on January 1, 1910	111,498
In state prisons and penitentiaries [2]	58,800
In reformatories for adults or for adults and juveniles	9,071
In county jails and workhouses	35,008
In municipal jails and workhouses	8,619

[1] Exclusive of those imprisoned for nonpayment of fine.
[2] Includes figures for United States penitentiaries.

The figures for the several censuses are not on the same basis and therefore are not closely comparable. There appears, however, to have been no material difference in scope between the census of 1880 and that of 1890. Nevertheless, the increase in the prison population as shown by these figures—an increase of about 40 per cent in 10 years as compared with an increase of about 25 per cent in the general population of the United States—seems too large to represent an actual growth and leads one to question whether the enumeration in 1890 may not for some reason have been more comprehensive or more efficient and complete than it was in 1880.

The fact that the number of prisoners enumerated in 1904 was slightly smaller than that in 1890 is not surprising in view of the change in the scope of the prison census, the census of 1904 being restricted to sentenced prisoners, exclusive of those imprisoned for nonpayment of fine, while that of 1890 included practically all persons confined in prisons or jails, for whatever reasons. For the purpose of comparison the following classes of prisoners should, therefore, be deducted from the total reported in 1890:

Prisoners not under sentence	10,120
Persons imprisoned for nonpayment of fine	3,691
Persons in military and naval prisons	794
Insane prisoners in hospitals and asylums	901
Total	15,506

If this total is deducted from the total number of prisoners enumerated in 1890, the remainder, 66,823, is properly comparable with the total number of prisoners enumerated in 1904, namely, 81,772. The comparison shows an increase of 14,949, or 22.4 per cent, in the number of sentenced prisoners exclusive of those sentenced to pay a fine and imprisoned for nonpayment. Within the same interval the general population increased about 30 per cent, with the result that the number of sentenced prisoners per 100,000 population declined from 106.7 in 1890 to 99 in 1904.

In 1910 the enumeration was again restricted to sentenced prisoners, but unlike the census of 1904 it included those committed for nonpayment of fine. For purposes of comparison with 1904, therefore, the number of such prisoners, 12,299, should be deducted from the 1910 total. After this deduction the total becomes 99,199, which, as compared with the number enumerated in 1904, shows an increase of 17,427, or 21.3 per cent. The general population increased about 11 per cent; and the number of sentenced prisoners per 100,000 population (not including those imprisoned for nonpayment of fine) increased from 99 in 1904 to 107.9 in 1910. But here again it is a question whether this increase may not be due in part to the greater completeness of the enumeration at the later census.

The total number of prisoners enumerated at each of these four censuses is shown by states in Table 2, which gives also the total population of the states and the number of prisoners per 100,000 population. The value of the figures, however, for the purpose of comparing conditions at one census with those at another is seriously impaired by the lack of uniformity already noted in the scope of the enumerations. The censuses of 1880 and 1890 are supposed to include all classes of prisoners and should therefore be comparable. But the censuses of 1904 and 1910, being confined to sentenced prisoners, are not comparable with the earlier censuses; and as the 1910 census included prisoners imprisoned for nonpayment of fine, while the 1904 census excluded this class, they are not comparable with each other.

[1] Including those imprisoned for nonpayment of fine.
[2] Exclusive of those imprisoned for nonpayment of fine.
[3] Figures for Dakota territory.

In the following table, in order to obtain figures which are more nearly comparable than the total number of prisoners enumerated at each census, the prisoners not under sentence and those confined in military or naval prisons or in insane asylums have been eliminated from the totals for 1880 and 1890, and those imprisoned for nonpayment of fine have also been eliminated from the totals for 1880, 1890, and 1910. The table thus relates to sentenced prisoners exclusive of those sentenced only to a fine and of those confined in military or naval prisons or in hospitals for the insane. On this basis the number of prisoners per 100,000

population shows no general tendency towards either an increase or a decrease, but alternately rises and falls, a movement which is not easily explained and may indicate variations in the scope or completeness of the census rather than changes in actual conditions. At any rate the conclusion seems justified that the increase in the number of prisoners is not much more than keeping pace with the growth of population. The ratio of prisoners to population has not fluctuated widely, and the normal ratio appears to be not far from 100 to 100,000, or 1 prisoner to 1,000 people. Therefore, so far as the number of prisoners on a given date may be accepted as an index of criminality the figures do not indicate that crime is increasing at an alarming rate in the United States.

Table 3

DATE.	SENTENCED PRISONERS, EXCLUSIVE OF THOSE IMPRISONED FOR NONPAYMENT OF FINE AND OF THOSE CONFINED IN MILITARY OR NAVAL PRISONS OR IN INSANE ASYLUMS.	
	Number.	Ratio per 100,000 population.
1880 (June 1)	49,527	98.7
1890 (June 1)	66,823	106.7
1904 (June 30)	81,772	99.0
1910 (Jan. 1)	99,199	107.9

In Table 4 the number of prisoners under sentence, not including those merely fined, is given by states, with the ratio per 100,000 population, for the years 1910, 1904, and 1880. The table does not cover the census of 1890 for the reason that the number of sentenced prisoners was not published separately by states at that census.

In 6 of the 9 geographic divisions and in 31 of the 45 states for which comparisons can be made, the ratio was higher in 1910 than in 1880. In some states the change was not very great, indicating practically stationary conditions. But in several states in the South and West the ratio more than doubled; it is probable that such changes reflect in part differences in the relative scope and completeness of the census of 1910 as compared with that of 1880. On the other hand, there are some states for which the ratio shows a rather pronounced decrease.

Comparing by geographic divisions the figures for 1910 with those for 1904, it will be found that in most divisions there was no very marked change in the ratio of prisoners per 100,000 population. In the South Atlantic, East South Central, and Mountain divisions, however, the ratio shows a very marked increase, which is probably mainly due to a greater degree of completeness in the enumeration of county and municipal jails in these sections at the census of 1910 as compared with that of 1904.

[1] Figures for Dakota territory.

PRISON COMMITMENTS.

In 1904 and 1910 the census of prisoners, as already explained, included the prisoners committed during the year as well as those in confinement on a given day. The number of sentenced prisoners reported as having been committed to prisons, jails, or reformatories during the year 1910 was 479,787, while the number in confinement on January 1, 1910, as already stated, was 111,498. The fact that the number

committed during the year so greatly exceeded the number in confinement on a given day means of course that the average term of imprisonment is much less than one year. In fact these statistics would indicate that the average was not over three months, the number of prisoners present on a given day being less than one-fourth of the number committed during the year.

Strictly speaking, the census recorded the number of commitments rather than the number of individuals committed. One number differs from the other because the same person may be committed more than once within the year. It would hardly be practicable, however, to distinguish all the "repeaters" or recidivists so as to include them only once in the census, and even if it could easily be done, it is a question whether the data would be any more valuable for statistical purposes. The number of commitments indicates the number of offenses committed and punished by imprisonment and, although it may tend to give an exaggerated impression regarding the number of persons responsible for these offenses, it is, in some respects at least, more significant than the number of different offenders. The burden upon the community involved in the arrest, trial, and punishment of offenders is no less when two offenses are committed by the same person on different occasions than it is when they are committed by different persons. Moreover, the second offense may differ from the first as regards its nature or degree, and as regards the penalty imposed. The same person, for example, may be convicted of drunkenness on one occasion and of assault on another, so that if the principle were adopted of tabulating each offender only once, it would be necessary to decide whether the data regarding offense, sentence, etc., should refer to the first commitment or the second.

The Bureau of the Census, nevertheless, made a count of the number of cases in which the identity of name and other facts indicated that the same person was committed to the same institution more than once during the year 1910. The total number of such cases was 34,979, that is to say, there were that number of individuals who according to this test were committed two or more times. Of these, 25,182 were committed twice, 5,960 three times, 2,085 four times, 892 five times, 397 six times, 216 seven times, 97 eight times, 57 nine times, and 93 ten or more times. The aggregate number of times these persons were committed was 87,257, and therefore if each individual had been counted only once, the total number of commitments, 479,787, would be reduced by 52,278 (87,257 − 34,979), or about 11 per cent. It may be noted, however, that not all cases of repetition will be revealed by identity of name, since the prisoner in order to avoid identification or recognition as a habitual offender, or for other reasons, may not give his real name or the name that he gave on the occasion of his previous commitment.

The total number of commitments of prisoners in the year 1910 represented a ratio of 521.7 per 100,000 population, indicating that in a typical or average community of 1,000 population there would be about 5 commitments to prisons, jails, or reformatories in the course of one year. The following table gives the number and ratio of commitments by states. To facilitate comparisons between different states the table includes five additional columns in which the ratios are distributed and classified within defined limits of size.

United States penitentiaries	987						

Comparing the geographic divisions, the ratio of commitments is highest in the Mountain division and lowest in the West South Central. Among the states the ratios ranged from 122.8 per 100,000 population in North Carolina to 3,392.6 in Arizona. This exceptionally high ratio for Arizona is partly attributable to the large Mexican element in that state, the natives of Mexico comprising about 15 per cent of the population but accounting for about 40 per cent of the prison commitments. The ratio of commitments, it may be noted, was higher in the District of Columbia than in any of the states except Arizona; but as regards economic and social conditions, the District belongs in a list of cities rather than of states, and it is probable that its ratio is not abnormally high for a city population containing a large Negro element.

The grouping of the states with reference to the ratio of commitments to population does not correspond very closely to sectional divisions. A wide diversity exists within most of the geographic divisions as well as in the country as a whole. The ratio is relatively high, however, in practically all the Mountain and Pacific states and relatively low in the West South Central states. The states with intermediate ratios, between 400 and 500 per 100,000, include all the East North Central states except Ohio, which had a ratio only slightly below 400.

The reasons for all these variations could be determined only by a painstaking and detailed study of local conditions in the several states and cities. It is impracticable to undertake any such investigation in connection with this report; but it is important to emphasize the fact that the ratio of commitments can not be accepted as an index of the relative degree of criminality or prevalence of crime in different communities, because a very large proportion of the prison commitments are for minor offenses, and the number of commitments for such offenses is in a large degree determined by the state laws and local ordinances and also by the practice of the courts and police regarding the definition and punishment of violations of law and order. Thus in one state the usual penalty for a given offense may be imprisonment, in another it may be imprisonment or a fine at the option of the court, and in a third it may be a fine followed by imprisonment only in case the fine is not paid. Of course, if the offender gets off with the payment of a fine, there is no record of his offense in the statistics of prison commitments.

As shown elsewhere in this report, for more than one-third of the total number of commitments the offense was drunkenness. As regards the treatment of this offense there is the greatest variation and latitude in different communities. It is a question in the first place of the policy followed in making arrests and in the next place of the disposition made of those who are arrested. In some communities it may be the practice to arrest all persons appearing on the streets or in other public places in an intoxicated condition; in other communities only those may be arrested who are especially disorderly or offensive. After the arrests are made it may be customary simply to lock up the offender over night and release him the next day, or it may be the rule to bring all the offenders before the local magistrate or police court judge. Of those brought before the magistrate a large proportion may be released without penalty as first offenders or on a promise of good behavior; or a large proportion may be let off with the payment of a fine; or finally, a large proportion may be committed to jail either under a sentence of imprisonment or for nonpayment of fine. Obviously, then, the ratio of commitments to prisons or jails on conviction of drunkenness depends upon a great many other factors besides the actual prevalence of drunkenness in the community; before one could determine the significance of the ratio in this respect it would be necessary to inquire what percentage of the persons becoming intoxicated are arrested, what percentage of those arrested are brought before the court, what percentage of those brought before the court are punished, what percentage of those punished are sentenced to imprisonment instead of being fined, and what percentage of those fined are committed to jails for nonpayment of fine. Thus it is clear that there is no fixed or uniform relation between the ratio of commitments and the prevalence of drunkenness. Only on the very improbable assumption that these various percentages are practically the same everywhere could the ratio be accepted as an index of the comparative amount of drunkenness in different communities.

To some extent, though probably to a smaller extent, the same factors affect the ratios of commitments for other offenses. In general it must be borne in mind that the number of commitments represents simply the number of violations of law which have been punished by imprisonment. A high ratio of commitments to population may, therefore, be indicative not so much of exceptional criminality and lawlessness as of exceptional efficiency on the part of the local authorities, the police, and the courts in following up infractions of the law, by detecting criminals and offenders and bringing them to trial. The ratio may thus reflect, in some degree, the public sentiment of the community as regards the punishment of crime and minor offenses.

It is evident, then, that all things considered, the aggregate commitments to prisons and jails without any differentiation by offense do not furnish any index of the amount of criminality in the community. Nevertheless, communities probably differ considerably as regards the occurrence of crime and other violations of law and these differences doubtless affect the number and ratio of prison and jail commitments, although just to what extent it is difficult to determine. Violations of law are without doubt more frequent in pro-

portion to population in urban communities than in rural. This is partly because cities attract the vicious, turbulent, and criminal elements in the population, and perhaps present more temptations and more opportunities for the commission of crimes and misdemeanors. But it results to a larger extent probably from the fact that as population becomes more congested human conduct must be more minutely regulated by laws and ordinances. One reason, therefore, why there is more lawbreaking in the city than in the country is that there are more laws to break. This is illustrated by the fact that one of the offenses distinguished in the classification adopted for the purposes of this report is "violating city ordinances," an offense which, as the name implies, relates to conditions peculiar to the cities and probably covers for the most part actions which in a distinctly rural community either could not occur at all or would be inoffensive if they did occur. There are in fact many lines of conduct which in cities are offensive and intolerable and inevitably lead to arrest but in a rural community are innocuous, at least so far as concerns the general public, and may entirely escape notice. This is to a large extent true of those acts which are punished as disorderly conduct and disturbing the peace. It is also to some extent true of drunkenness, which in a sparsely settled region may occur without causing much annoyance to the community at large.

The racial composition of the population doubtless has considerable influence on the amount of lawbreaking. Figures presented in another connection (see pp. 87 and 106) show that there are proportionately more commitments among the Negro population than among the white, and more among the foreign-born white population than among the native white. Moreover, there appears to be considerable difference in this respect between the different classes of immigrants as distinguished by country of birth. The sex and age composition is another factor of some importance in this connection. The great majority of the offenders committed to prisons and jails are adult males; only about 2 per cent of the total number of prisoners and juvenile delinquents committed in 1910 were under 15 years of age and only about 10 per cent were females. It follows, therefore, that a community or class in which there is a relatively large percentage of adult males is likely to have a higher ratio of prison commitments than one in which there is a relatively large proportion of females and children. In fact it will be found from statistics presented in another section (see p. 118) that the difference just noted between the native white and foreign-born white as regards the ratio of commitments is largely accounted for by the difference in the age composition of the two classes.

That illiteracy is a factor which may have some connection with the frequency of prison commitments is indicated by statistics presented elsewhere in this report (see p. 144). These statistics show, at any rate, that the percentage of illiteracy is higher among prisoners than in the general population in the same community; but, on the other hand, it is a question whether in some communities where there is a high degree of illiteracy there may not be, as compared with other communities, a more lax enforcement of the laws and fewer legal restrictions or prohibitions, particularly as regards such offenses as drunkenness, disorderly conduct, vagrancy, and prostitution. In short, there may be in such communities less law and likewise more lawlessness than in other communities where the population is less illiterate.

For the convenience of the reader who may wish to compare the ratio of prison commitments with the characteristics of the general population, Table 6 has been included, which shows respectively the percentage urban, foreign-born, Negro, adult male, and illiterate in the general population of each state as well as the ratio of commitments; it shows also the rank of the states in each of these particulars.

As already explained, the census of 1910, unlike that of 1904, included prisoners committed for nonpayment of fine. The nonpayment class contributed 11 per cent of the total number of prisoners enumerated on January 1, 1910, and about 58 per cent of the total number committed during the year. It is evident, then, that the inclusion of this class of prisoners has a much greater effect upon the total number of prisoners committed than upon the total number in confinement on a given date, and that as regards commitments, at any rate, the totals in a census which excluded this class of prisoners have no value whatever for comparison with totals in a census which included them. It is possible to deduct this class from the totals for the census of 1910, and theoretically the result should give a figure which is comparable with the totals for 1904. But as a matter of fact the enumeration of prisoners committed appears to have been more complete in 1910 than it was in 1904, partly because of the change in the method of securing the returns described on page 14 and partly because the list of penal institutions canvassed was more comprehensive, particularly as regards the inclusion of the smaller county and municipal jails.[1] In fact the institutions canvassed at the census of 1904, not including juvenile reformatories, were

[1] Apparently the rule followed in 1904 was to include only those institutions which reported inmates on a given day. In 1910 the rule was extended to include also those which reported any commitments during a given year. Since the prisoners committed to county and municipal jails serve as a rule only short terms of imprisonment, it will frequently be the case as regards the smaller institutions of this class that they have no inmates on a given day and yet receive a very considerable number of commitments in the course of a year. In fact in the census of 1910 there were 573 county jails and 299 municipal jails which reported no inmates on Jan. 1, 1910, but reported commitments during the year 1910, the aggregate number of commitments to these institutions being 19,219, or 4 per cent of the total number of commitments reported.

hardly more than two-fifths as many as those included in the census of 1910, the number being 1,337 in the earlier census as compared with 3,171 in the later. The difference of course does not represent the increase in the number of penal and reformatory institutions in existence, but indicates mainly a greater degree of completeness in the census of 1910.

Table 6

Division and state.	Ratio of prisoners committed per 100,000 population: 1910.	Per cent of total population: 1910.				Per cent illiterate in total population 10 years of age or over: 1910.	Rank of division or state with respect to—					
		Urban.	Foreign born.	Negro.	Adult males.		Ratio of commitments.	Per cent urban.	Per cent foreign born.	Per cent Negro.	Per cent adult males.	Per cent illiterate.

For the reasons stated, even when the figures for the two censuses are placed upon the same basis by excluding the "nonpayment" prisoners in 1910, it is doubtful whether comparisons have much significance or can be accepted as indicative of changes in actual conditions. In Table 7, however, the number of prisoners reported as committed in 1904 is given by states side by side with the number in 1910 exclusive of prisoners imprisoned for nonpayment of fine.

United States penitentiaries	987	987	(2)

[1] Includes commitments to the United States penitentiary located in this state
[2] Included with the figures for the states in which located.

The total number of commitments reported, not including commitments for nonpayment of fine, increased from 149,691 in 1904 to 200,873 in 1910, an increase of 51,182, or 34.2 per cent. The total population of the United States in the same interval increased about 11 per cent and the ratio of commitments per 100,000 population advanced from 181.2 in 1904 to 218.4 in 1910. As shown by figures presented in Table 4, the reported number of prisoners in confinement on a given day, not including nonpayment prisoners, increased from 81,772 in 1904 to 99,199 in 1910, an increase of about 21 per cent. So far as the figures are affected by the fact that the census of 1910 was more complete than that of 1904, it is not surprising that the increase should be greater in relation to prison commitments than to prison population, because the institutions which are likely to be overlooked or omitted are the county or municipal jails, in which the number of prisoners confined at any one time is small as compared with the number committed during the year. The inclusion or exclusion of such institutions would, therefore, have a much greater effect upon the total number of prison and jail commitments reported than upon the total prison and jail population.

CLASS OF INSTITUTION.

Of the 111,498 prisoners enumerated on January 1, 1910, 58,800, or 52.7 per cent, were confined in state or Federal prisons or penitentiaries; 43,627, or 39.1 per cent, were confined in county or municipal jails or workhouses; and 9,071, or 8.1 per cent, were in reformatories. Of the 479,787 commitments to penal institutions in the year 1910, only 21,968, or 4.6 per cent, were commitments to prisons or penitentiaries, state or Federal, while the commitments to county or municipal jails or workhouses numbered 452,055, representing 94.2 per cent of the total number. Thus while the commitments to county and municipal jails are more than twenty times as numerous as the commitments to state or Federal prisons and penitentiaries, the population of the jails on any given date is only about three-fourths as great as that of the prisons. This contrast between population and commitments as regards the proportion reported for each class of institutions is obviously explained by the fact that most of the prisoners sent to state prisons have been convicted of grave crimes and are sentenced to relatively long terms of imprisonment, while the commitments to county or municipal jails represent for the most part minor offenses punishable by short terms; consequently the jail population on a given day is small as compared with the number of persons committed to such institutions, while in the case of state prisons the opposite is true. In fact in the case of the jails the ratio of prisoners enumerated on January 1 to prisoners committed during the year was about 1 to 10, while in the case of the state prisons the corresponding ratio was about 2½ to 1. This would indicate that the average sojourn in jails was about one-tenth of a year, or a little more than one month, and that the average term in state prisons was about 2½ years. But these averages obtained by

dividing the prison population on January 1 by the number of commitments during the year must not be accepted as anything more than a rough indication of the actual average length of confinement in these two classes of institutions. The length of sentence is a subject of special consideration in one of the sections which follow (see p. 42), and is referred to here only to explain the contrast noted between prisons and jails as regards the relative number of inmates and commitments.

It should be noted in this connection that the "county jails" in this classification of institutions include in a few instances houses of correction which are really state institutions but have nevertheless been included with the county jails because they provide for substantially the same class of minor offenders, while the state prisons and penitentiaries receive as a rule only those offenders who are convicted of serious offenses or crimes penalized by long terms of imprisonment or by the death sentence.

General Table 1 (p. 204) gives by states the number of prisoners and also of juvenile delinquents confined in or committed to each class of institutions. Table 8, given below, shows for prisoners only the distribution by class of institutions for each geographic division.

The percentage of state prison convicts in the total number of prisoners enumerated or committed was exceptionally large in the two south central divisions and exceptionally small in New England; and in general the percentage was higher in the Southern and Western states than in the Northern and Eastern.

While the percentage of state prison convicts in the total number of prisoners is determined primarily by the relative number of grave crimes represented in the total number of convictions resulting in prison or jail commitments, the line of demarcation between state prison offenses and other offenses is not the same in all states; and in some states the state prisons receive a considerable number of minor offenders sentenced for comparatively short terms (see General Tables 64 and 72, pp. 421 and 429.) The existence of a state reformatory for adults tends to keep down the number of state prison convicts, the inmates being mostly of the class which in the absence of such a reformatory would be committed to the state prison; such reformatories were in existence in 1910 in 15 states, most of them Northern states. Another factor which probably reduces the proportion of state prison commitments is the presence of a large urban population, since with the growth and multiplication of cities the number of minor offenders who are committed to the local municipal or county jails probably increases more than the number of state prison convicts.

The ratio of commitments to state prisons per 100,000 population, as shown by Table 9, on the following page, was in general higher in the Southern and Western states than in the Northern; it was highest (58) in the Mountain division and lowest (8.5) in New England. The ratio of commitments to county and municipal jails per 100,000 population, on the other hand, was relatively high in New England (750), although not as high as in the Mountain division (778.4) or the Pacific (766.3); and was relatively low in the two south central divisions, being lowest (264.7) in the West South Central.

These variations are probably attributable largely to causes which have already been considered as affecting the total ratio of commitments to all classes of penal or reformatory institutions (see p. 19). The county and municipal jails in particular provide as a rule for minor offenses only, and as already noted the laws defining and penalizing such offenses vary greatly in different communities, as does also the rigor with which these laws are enforced by the police and the courts. The state prison commitments, although as a

rule they relate only to the more serious offenses or crimes, which are almost universally proscribed and penalized either by common law or by statutes, are nevertheless affected in some degree by the same influences and, moreover, include in some states commitments for certain minor offenses which in other states are punished by jail commitments. The composition of the population as regards age, sex, and race, the proportion of the population living in urban communities, and the percentage of illiteracy are factors the influence of which has already been considered.

[1] The Vermont State Prison failed to report commitments.

MOVEMENT OF PRISON POPULATION.

During the year 1910, according to the returns of the census, the prisons, jails, and reformatories in the United States received 479,787 sentenced prisoners, and discharged or paroled 461,255. The number of prisoners who died within the year was 1,416 and the number transferred to insane asylums, sanatoria, hospitals, or other nonpenal institutions was 1,696. These figures indicate the movement of prison and jail population. Evidently it is a shifting population in the sense that the units composing it are rapidly changing. Reduced to a per diem basis these figures indicate that prisoners were being received at the rate of 1,314 daily and were being discharged or paroled at the rate of 1,264 daily.

As already pointed out, the number of commitments reported during the year does not represent that number of different individuals, and this is of course equally true of the number of discharges. The same person may be committed and discharged more than once in the same year; and probably a large proportion of the persons annually imprisoned have already served a prison or jail sentence either in the same year or in some previous year.

The difference between the number of commitments and the number of discharges, deaths, and transfers to nonpenal institutions should represent approximately the net gain in prison and jail population during the year. In fact, however, this difference, 15,420, which is equivalent to an increase of about 14 per cent in the population reported for January 1, seems altogether too large, for if the prison and jail population increased by that amount every year it would double in less than 8 years, whereas the figures given in Table 3 show that it only doubled in the 30 years from 1880 to 1910. This inconsistency may be partly due to the

fact that the census returns did not include losses by escape, but the more probable explanation is that the returns for discharges were less complete than those for commitments, thus making the difference, or net gain, too large. This may have some relation to the fact that the pay which the officers or employees of the prisons or jails received for filling out the census schedules was adjusted with reference to the number of commitments reported and was not affected by the number of discharges. It may be noted that in the case of the state prisons, the returns for which are doubtless more reliable and complete than those for the jails and workhouses, the net gain of 396 was equivalent to an increase of only about 0.7 per cent, which does not seem too large.

"PRISONERS" AND "JUVENILE DELINQUENTS."

In this report the term "prisoners" is applied to persons confined in or committed to prisons, jails, or workhouses, and also reformatories for adults or for adults and juveniles. The inmates of those reformatories which are exclusively for juveniles, on the other hand, are designated as "juvenile delinquents," the somewhat opprobrious term "prisoner" being deemed unsuited for this class of youthful offenders, who have been placed under restraint primarily for purposes of education and reform. In 1904 the statistics relating to juvenile delinquents were presented in a separate section of the census report entirely distinct from those relating to prisoners. Unquestionably the subject of juvenile delinquency is of sufficient distinctness and importance to merit treatment in a separate section; but to the writer it seemed that the fundamental basis of distinction should be the age of the offenders rather than the class of institutions in which they are confined or to which they are committed. The youthful inmates of jails and prisons are confined in these institutions not because they are necessarily guilty of more serious offenses than those committed by the inmates of juvenile reformatories, but rather because the importance of making separate provisions for the juvenile offender and treating him as a delinquent to be reformed and not as a criminal to be punished has not as yet been fully recognized in all communities. In the present report, although the distinction between juvenile delinquents and prisoners has been maintained and the two classes have been differentiated, totals for both classes combined are generally presented in connection with the particular subject under consideration, whether it is age, sex, offense, or juvenile delinquency. The reasons which seem to justify this departure from the policy followed in the previous report are presented at greater length in the section on juvenile offenders (see pp. 154, 155).

The number of inmates of juvenile reformatories reported on January 1, 1910, was 24,974; on June 30, 1904, it was 23,034. The number reported as committed to this class of institutions was 14,147 in 1910 and 11,814 in 1904. Table 12 gives the number of prisoners and juvenile delinquents separately by states for the year 1910. It may be noted that there were seven states from which no juvenile delinquents were reported on the date of enumeration. In the case of three of these states (North Carolina, South Carolina, and Idaho) no returns were received from the state reformatories for juveniles; in the other four (Mississippi, Oklahoma, Wyoming, and Nevada) however, no juvenile reformatories were in existence on the date of enumeration, and the youth who was convicted of an offense punishable by imprisonment was committed to a jail or prison, except that in Oklahoma an institution for juvenile delinquents was opened during 1910.

As indicating the extent to which juvenile offenders are committed to other institutions, it may be stated in this connection that 911 offenders under 18 years of age were committed in 1910 to Federal or state prisons or penitentiaries, 6,325 to county jails, 3,539 to municipal jails, and 1,141 to reformatories for adults or adults and juveniles. All these are classified as "prisoners" and not as "juvenile delinquents," forming a total of 11,916 which is not much below the total number (13,506) of juvenile delinquents under 18 years of age.

The table also gives the ratio of commitments in 1910 for prisoners and for juvenile delinquents separately and combined. In the following sections of this report figures are generally presented for both classes in combination because in most relationships, as already explained, the totals are believed to be more significant and more complete than the figures for prisoners alone. In most states the figures for prisoners in the aggregate are not materially affected by the inclusion of the relatively small number of juvenile delinquents.

OFFENSE.

CLASSIFICATION.

In classifying prisoners with reference to the crime or offense of which convicted it was not considered advisable for the purposes of this report to distinguish every variation in the terminology used by the courts and reported on the schedules. That appears to have been done in the 1890 report on prisoners, which distinguished 590 different offenses; of this number, however, 161 were represented by only 1 prisoner each and 372, including the 161 just mentioned, were represented by less than 10 prisoners each. The 1904 report, going perhaps to the other extreme, gave a very brief list of offenses comprising only 26 definite designations.

Of necessity the designations which may be used can only indicate in a broad way the general nature of the offense for which the prisoner was committed. If there was one criminal code for the entire United States it would be possible to use terms which had a precise and invariable meaning; but with 48 states having distinct codes of criminal law, strict uniformity and precision in the definition of terms are unattainable. The same term may be differently defined or applied in different states or in different communities within the same state. Moreover, to a considerable extent the various terms used by the courts in defining offenses indicate only minor differences in the precise nature of the offense or in the circumstances under which it was committed. It would be hardly practicable, even if it were worth while, to differentiate consistently the various forms and degrees of assault, larceny, or burglary, for instance, on the basis of information contained in the schedules as filled out by officials of county and municipal jails throughout the entire United States.

The list of offenses finally adopted for the present report includes 69 designations, which are grouped under 11 main classes. Although any such grouping presents difficulties, it is obviously desirable to have some sort of classification under which the various specified offenses may be summarized. The one adopted here is not regarded as altogether satisfactory or above criticism, but it follows in its essential features that of previous census reports and rests in part upon distinctions long recognized in the common law. It may be described as an attempt to classify offenses with reference to the principle or right of which they are a violation. Thus homicide and assault are classified as offenses against the person; larceny, fraud, and burglary as gainful offenses against property; trespassing and malicious mischief as nongainful offenses against property; prostitution and fornication as offenses against chastity; contempt of court, resisting an officer, and perjury as offenses against the administration of government; carrying concealed weapons and violation of city ordinances as offenses against public health and safety; drunkenness, disorderly conduct, and vagrancy as offenses against sobriety and good order; gambling, violation of liquor laws, and profanity as offenses against public policy; nonsupport and cruelty to wife or child as offenses against the prisoner's family; and incorrigibility and truancy as offenses peculiar to children.

SUMMARY.

The detailed list of offenses arranged by classes is shown in Table 13, with the number convicted for each offense among the prisoners and juvenile delinquents enumerated on January 1, 1910, and among those committed during the year 1910.

[1] Included with "all others" of this class.

In Table 14 the list of offenses comprises all those for which more than 900 prisoners and juvenile delinquents were committed during the year 1910, the offenses being arranged in the order of the number of commitments and the relative importance of each offense being indicated by its percentage of the total number of prisoners and juvenile delinquents in confinement on January 1, 1910, and of the total number committed during the year.

[1] Less than one-tenth of 1 per cent.

The above table brings out the marked contrast between the prison population and the prison commitments as regards the proportions of the total number convicted of different offenses. For instance, 10.5 per cent of the prisoners and juvenile delinquents enumerated on January 1 had been convicted of homicide, as compared with only 0.6 per cent of those committed during the year, whereas only 10.2 per cent of the former, as compared with 53.2 per cent of the latter, had been convicted of drunkenness or disorderly conduct. The contrast results of course from the fact that the term of imprisonment is so much longer for offenders guilty of grave crimes than for minor offenders. In fact the relative seriousness of the different classes of offenses as expressed by the penalty imposed is roughly indicated by the figures in the last column of the table showing the ratio of prisoners enumerated to prisoners committed; and if the number of commitments underwent no change year by year and the sentence imposed for the same offense also remained fixed, this ratio would show with approximate accuracy the average length of imprisonment for each class of offenses. In the case of grave homicide the average would be 7.14 years, in the case of robbery 2.86 years, in the case of larceny about two-thirds (0.65) of a year, and in the case of drunkenness about one-twentieth (0.05) of a year, or about 18 days. Owing to changing conditions, however, these are, of course, only very rough approximations to the true averages; and as regards grave homicide it should be borne in mind that in the case of many of the prisoners committed for this offense the length of imprisonment is comparatively short, being the interval between commitment and the execution of the death sentence.

The distribution by offense of the prisoners enumerated on a given day may be regarded as indicating roughly the apportionment of the cost of guarding and maintaining the prisoners on the assumption that it costs as much per day to keep one prisoner as another. Thus on that assumption 20.4 per cent, or one-fifth, of the total cost would be chargeable to larceny, 10.5 per cent to homicide, and 6.3 per cent to drunkenness. Similarly, on the assumption that it costs as much to arrest and convict one offender as another the distribution by offense of the prisoners committed during the year would indicate the apportionment of the total cost of the trial and conviction of prisoners. But such an assumption is too far removed from the facts to be worth considering, for the cost of trial is obviously much greater for a grave crime, such as homicide or burglary, than for a minor offense, such as disorderly conduct or drunkenness. Moreover, a trial that results in acquittal or in the imposition of a fine may be just as expensive as one that ends in conviction and imprisonment.

Of the total number of commitments in the year 1910, 170,977, representing 34.6 per cent, or more than one-third, were for drunkenness; 91,928, representing 18.6 per cent, or almost one-fifth, were for disorderly conduct; and 50,302, or 10.2 per cent, were for vagrancy. These are the three leading offenses as regards number of commitments, and in the aggregate accounted for 63.4 per cent, or nearly two-thirds, of the total. Next in rank comes larceny, for which there were 42,716 commitments, representing 8.6 per cent of the total. For assault there were 22,670 commitments, or 4.6 per cent of the total. After assault, the offense of most frequent occurrence is fraud (including train riding), which resulted in 8,936 commitments, this being followed by burglary, with 8,922, and trespassing, with 8,435.

CLASS OF INSTITUTION.

Table 15 distributes the commitments for each specified offense according to the kind of penal or reformatory institution to which the prisoners were committed. The list of offenses is alphabetically arranged and includes every offense for which there were at least 900 commitments.

The majority of the commitments for the most serious offenses, including homicide, rape, robbery, and forgery, were to state prisons, the exact percentages being 93.1 for grave homicide, 86.6 for lesser homicide, 60.5 for rape, 59 for robbery, and 58 for forgery. In the case of burglary the proportion of commitments to state prisons was practically one-half (49.8 per cent). The only other offenses for which the percentage exceeds 10 were embezzlement (19.7), larceny (11.5), and assault (10.4).

Reformatories for juveniles naturally received nearly all the commitments for distinctly juvenile offenses, such as delinquency, incorrigibility, and truancy. As regards the other offenses the great majority of the commitments were to county or municipal jails; and of these two classes of institutions the county jails in most instances received the larger number of prisoners. This is probably because the county jail covers a larger contributory population than the municipal jail, which, as the name implies, is generally confined to cities, and moreover is not found in all sections of the United States or in every city. Naturally the municipal jails received an exceptionally large proportion—75.7 per cent in fact—of the commitments for violation of city ordinances. They also received more than one-half—57.6 and 52.4 per cent, respectively—of the commitments for profanity and prostitution. For disorderly conduct the percentage committed to municipal jails was 46.7, for obscenity 45.7, for drunkenness 43.6, for gambling 40.8, and for keeping a house of ill fame 39.9.

[1] Less than one-tenth of 1 per cent.

More than three-fourths of the commitments for the following offenses were to county jails: Contempt of court (84.9 per cent), fraud (82.5 per cent), trespassing (80.7 per cent), violating liquor laws (78.9 per cent), injuries to common carriers (77.2 per cent), and adultery (75.4 per cent).

Referring to the last section of the table, it will be found that drunkenness and disorderly conduct accounted for 66.6 per cent of the commitments to municipal jails and 52.6 per cent of those to county jails. Homicide, larceny, burglary, assault, and forgery combined were responsible for 74.1 per cent of the commitments to state prisons and 72.6 per cent of the commitments to reformatories for adults; but of the commitments to county and to municipal jails these offenses contributed only 15.2 per cent and 7.3 per cent, respectively.

GEOGRAPHIC DIVISIONS.

The following table shows by geographic divisions the total number of commitments for the principal offenses and their ratio to the population.

[1] Includes figures for United States penitentiaries, which are not shown separately in this table.

Since comparisons between different sections of the country as regards the ratio of commitments for specific offenses may prove invidious, it may be well to repeat again the caution against accepting these ratios as indicative of the habits or morals of the population concerned. They may indicate rather differences in the laws and in the efficiency with which these laws are enforced. It may be well to point out that a specific act does not constitute an offense unless or until there is a law prohibiting it. In this sense offenses are called into existence by the laws which penalize them. The juvenile offense of truancy, for instance, does not exist in some sections or communities. It is true that most of the offenses in the list here presented represent broadly actions which are everywhere proscribed by law. Nevertheless, as regards the exact scope and definition of the given offense and its penalization, the laws may differ widely in different communities.

Of the several divisions, New England has the highest ratio of commitments for drunkenness and for fornication, as also for nonsupport and the juvenile offenses of truancy and incorrigibility. It has the lowest ratios for homicide, forgery, disorderly conduct, and contempt, and shares with the West North Central division the distinction of having the lowest ratio of commitments for carrying concealed weapons.

The Middle Atlantic division has the highest ratios for disorderly conduct, trespassing, fraud, and injuries to common carriers, while it has the lowest for larceny, gambling, violating liquor laws, and profanity, and, with the West South Central division, shows the lowest ratio for obscenity.

In the case of the East North Central division the ratios for the several offenses shown separately in Table 16 do not in any case constitute the highest for the offense, while its ratio for burglary, which is the same as that for the West North Central, is the lowest for that offense.

The West North Central division has the highest ratio of commitments for prostitution and for violation of city ordinances and the lowest for assault and for fraud; it shares with other divisions the distinction of having the lowest ratios for burglary and carrying concealed weapons, as already stated, and also for embezzlement and injuries to common carriers.

In the South Atlantic division the ratios for assault and profanity are higher than in any other division and the ratios for the juvenile offenses of delinquency and truancy lower than in any other.

The East South Central division has the highest ratios for homicide, adultery, carrying concealed weapons, gambling, and violating liquor laws; it is represented by the minimum ratio for vagrancy and also, together with the West North Central division, for embezzlement.

The West South Central division does not show the maximum ratio for any offense, but has the lowest ratios for rape, fornication, robbery, drunkenness, violation of city ordinances, keeping house of ill fame, malicious mischief, and incorrigibility, while, with other divisions, it shows the lowest ratios for obscenity and injuries to common carriers.

The ratios of commitments for burglary, forgery, robbery, larceny, embezzlement, rape, keeping house of ill fame, and contempt are higher in the Mountain division than in any other; for none of the offenses given in the table does this division show the minimum ratio.

The Pacific division has the highest ratios of commitments for vagrancy, obscenity, malicious mischief, and delinquency, and the lowest ratios for adultery, prostitution, nonsupport, and trespassing, while, with other divisions, it shows the lowest ratio for injuries to common carriers.

In the last three columns of Table 16 figures are presented for each of three grand subdivisions of the United States, designated as the North, the South, and the West. The North as here defined includes New England and the Middle Atlantic and two north central divisions; the South includes the South Atlantic and two south central divisions; and the West includes the Mountain and Pacific divisions.

The ratio of commitments for all offenses combined is highest in the West and lowest in the South. This is also true of the ratios for drunkenness, disorderly conduct, and vagrancy, which are the three leading offenses in point of commitments and to a large extent determine the ratio for the total. For these three offenses combined the ratio in the North was 371; in the South 225.1; and in the West 588.9. The ratio for all other offenses combined was 176.1 in the North, 219.5 in the South, and 249.9 in the West.

The North has the highest ratios for fornication, prostitution, violation of city ordinances, nonsupport, and the juvenile offenses of incorrigibility and truancy; the South for homicide, assault, carrying concealed weapons, and violating liquor laws; and the West for robbery, burglary, larceny, fraud, forgery, rape, obscenity, and delinquency, and as already stated, drunkenness, disorderly conduct, and vagrancy.

In the preceding table figures by geographic divisions have been presented for all offenses for which more than 900 prisoners or juvenile delinquents were committed in the year 1910. In the tables which immediately follow similar statistics for certain selected offenses are presented by states. The detailed offense classification for prisoners is given by states in General Table 39 (p. 360) and a summary classification for juvenile delinquents in General Table 69 (p. 426). In the text tables here presented the figures for prisoners and juvenile delinquents are combined.

SPECIFIC OFFENSES.

Homicide.—The next table shows by states the commitments for homicide, which in 1910 numbered 2,902. As compared with the commitments for other

offenses this is a small number—in fact it constitutes only six-tenths of 1 per cent of the total number of commitments for all offenses; but because of the gravity of this offense the figures possess special interest. The statistics in the table distinguish grave homicides from lesser homicides, usually upon the basis of the sentence imposed, cases in which the sentence was death or imprisonment for life or for 25 years or more being as a rule classified as grave homicides.

[1] Exclusive of commitments to juvenile reformatories.
[2] The Vermont State Prison failed to report commitments.
[3] Less than one-tenth of 1 per cent.
[4] Includes commitments to the United States penitentiary located in this state.
[5] Included with the figures for the states in which located.

The ratio of commitments for homicide per 100,000 population in 1910 was 3.2. Taking for illustration a typical or average community of 1,000 population, this ratio would indicate that in such a community there would be 1 commitment for homicide in about 33 years or about 3 in 100 years.

Among the several geographic divisions New England had the lowest ratio, 1 per 100,000. In each of the other three northern divisions (the Middle Atlantic and the East and West North Central) the ratio was either 1.5 or 1.4. Higher ratios prevailed in the South and West, the highest being that for the East South Central division, 7.7 per 100,000.

The states having a ratio below 1 per 100,000 were New Hampshire, Massachusetts, Rhode Island, Iowa, and South Dakota. The ratios exceeded 10 per 100,000 in Florida, Mississippi, Arizona, and Nevada. No commitments were reported for the state of Vermont or for the District of Columbia. In explanation it should be noted that the returns for Vermont were incomplete and that persons convicted of homicide in the District of Columbia are not, as a rule, committed to District penal institutions but are sent either to Federal or state prisons.

In general there is no available statistical basis for a comparison between the amount of crime committed and the amount punished. But as regards homicide a fairly satisfactory basis for such a comparison exists in the statistics of mortality compiled and published by the Bureau of the Census, which show for the registration states the number of deaths reported as homicides. While it is true that the statistics are somewhat deficient because of indefinite or erroneous returns,[1] yet the deficiency is probably not great enough to destroy the value of a comparison. The list of registration states for which mortality reports were obtained in 1910 included all the New England states and outside New England the states of California, Colorado, Indiana, Maryland, Michigan, Minnesota, Montana, New Jersey, New York, Ohio, Pennsylvania, Utah, Washington, and Wisconsin. In these states, which comprised 51 per cent of the total population of the United States, the aggregate number of homicides reported in 1910 was 2,133, while the aggregate number of commitments for homicide was 719, or about one-third of the number of homicides reported. Although of course many and possibly a majority of the homicides for which prisoners were committed in 1910 occurred prior to that year, that does not vitiate the comparison to any appreciable degree, because the figures for 1910 may be accepted as representing annual averages at that period and the commitments in 1910 are probably more nearly comparable with the homicides of that year than with those of the previous year. The comparison indicates, then, that about one homicide in three is punished; the unpunished homicides, however, do not by any means necessarily represent a failure of justice so far as the courts are concerned, for they include those "mysteries" in which there is no clue to the murderer, and also justifiable and accidental homicides.

The evidence of these statistics, it may be noted, is widely at variance with sensational statements that have from time to time appeared in the newspaper or periodical press claiming that the chances of the detection and punishment of murder in the United States are very small or almost negligible. In view, however, of the probability that the number of reported homicides is somewhat below the actual number, partly because, as already stated, the mortality returns are not always explicit, and partly because a murder may be committed without being discovered, and may, therefore, in good faith be returned as a suicide or a death due to natural or accidental causes, it may be admitted that the ratio of one to three exaggerates somewhat the probability of detection and conviction. It should be borne in mind, moreover, that this ratio applies only to the registration states as specified above. Figures covering the entire United States would not improbably give a somewhat different result.

In the case of most offenses comparisons of the 1910 statistics with the results of the previous census of prisoners taken in 1904 are likely to be misleading on account of the omission at the earlier census of prisoners committed for nonpayment of fine. Moreover, there is reason to believe that the census of 1904 came far short of including all the commitments to municipal and county jails. As applied to homicide, however, these objections are not serious, since almost all prisoners convicted of this offense are committed to state institutions and the sentence of a fine only would be most unusual, if indeed it occurred at all.[2]

For the United States as a whole, the ratio of commitments for homicide was slightly higher in 1910 than in 1904, 3.2 per 100,000 as against 3. In three of the geographic divisions—New England, the Middle Atlantic, and the East North Central—there was no change, the ratio in 1910 being practically the same as in 1904; and in two divisions—the West South Central and Mountain—the change was very slight. In the South Atlantic and East South Central divisions

[1] A homicide may, for instance, be reported simply as a death caused by poisoning or by drowning or by gunshot wounds. In recent years, however, it has been the practice of the bureau to follow up such indefinite returns by letters of inquiry asking whether the death was a case of homicide or not. As a result of these efforts the number of cases of reported homicide has shown an increase which is sometimes misconstrued as representing the increase in the actual number of homicides.

[2] Of the 2,902 prisoners and juvenile delinquents committed for homicide in 1910, all but 327 were committed to state institutions. The 2 cases reported as commitments for the nonpayment of fine may be regarded as of doubtful authenticity.

there was a considerable increase in the ratio, while in the West North Central and Pacific divisions there was a somewhat pronounced decrease.

Among the states which show rather marked increases in the ratio of commitments for homicide are Maine, Connecticut, Minnesota, Virginia, North Carolina, South Carolina, Georgia, Florida, Mississippi, Oklahoma, Wyoming, and New Mexico. Although seven of these states are Southern states, the list, it may be noted, represents a wide distribution geographically. This is even more true of the list of states showing decreases, some of the more marked decreases being shown by the states of Rhode Island, Delaware, North Dakota, South Dakota, Kansas, Louisiana, Montana, Colorado, and California. The very marked decrease in the case of Kansas (from 6.9 per 100,000 in 1904 to 2.1 in 1910) is largely explained by the fact that the figures for 1904 included commitments to the United States Penitentiary at Leavenworth, while in the 1910 figures these commitments were excluded.[1]

Rape.—Rape is a crime hardly less heinous than murder and in some states is penalized by death, and in states where that is not the case, by imprisonment for life or for a long term of years. In the classification used for the purposes of this report, however, the term "rape" was interpreted rather broadly to include offenses defined as "defiling child," "indecent assault," "indecent liberties with child," etc., and also those cases where rape was not actually committed, but only attempted or intended. Perhaps this is one reason why the number of commitments for rape reported at the census of 1910—1,377, after excluding for purposes of comparison the juvenile delinquents (74) and prisoners committed for nonpayment of fine (29)—is so much larger than the number reported in 1904, which was 620. No record, however, has been preserved showing what this offense included in 1904, but in any event the increase is altogether too large to represent an actual increase in the occurrence of the offense and for that reason comparative figures are not included in Table 17, which shows the figures for the year 1910.

The total number of commitments for rape, 1,480, was equal to about one-half the number of commitments for homicide (2,902), and constituted less than one-third of 1 per cent of the total number of commitments for all offenses. The ratio of commitments for rape was 1.6 per 100,000 population, indicating that in a typical community of 1,000 inhabitants there would be one such commitment every 63 years.

Among the geographic divisions the ratio of commitments ranged from 1.1 per 100,000 in the West South Central division to 2.6 in the Mountain division; and among the states from 0.3 in Vermont and in Idaho (representing in each state one offense only) to 4.4 in Colorado. In the case of Vermont, however, the figures may be incomplete, as the state prison officials failed to make any returns of commitments, the one case reported being that of a juvenile delinquent committed to the state industrial school.

Assault.—Assault belongs in the same general class of offense as homicide, being an offense against the person which not infrequently involves homicidal intent. There is a wide variation of degree in the gravity of this offense, but in this report no attempt has been made to distinguish different degrees or forms of assault.

The ratio of commitments for assault in 1910, as shown in Table 18, was 24.6 per 100,000 population for the United States as a whole and ranged in the individual divisions from 13.3 per 100,000 in the West North Central division to 37.1 in the South Atlantic. The ratio was conspicuously high in the District of Columbia, but it should be remembered in this connection that the District as regards social and economic conditions belongs in a list of cities rather than of states. It is fairly certain that if corresponding figures for other cities could be presented the ratio for the District would not appear abnormally large.

Robbery, burglary, and larceny.—Table 18 gives combined figures for three related offenses against property rights, namely, robbery, burglary, and larceny. Of these the most important as regards the number of commitments is larceny, for which there were 42,716 commitments in 1910; the commitments for burglary numbered 8,922, and those for robbery 1,728. In the aggregate the commitments for these offenses comprised 10.8 per cent of the commitments for all offenses and represented a ratio of 58 commitments per 100,000 population. The ratio was exceptionally high in the Mountain division (105 per 100,000) and considerably above the average in the Pacific and New England divisions (79.2 and 75.3 per 100,000), while it was somewhat above the average in the South Atlantic division (66.4 per 100,000). In the remaining five divisions the ratios were remarkably even, deviating but little from 50 per 100,000.

[1] As the commitments to the United States Penitentiary for murder or manslaughter numbered 63 in the fiscal year 1904 and 46 in the fiscal year 1905, it is probable that such commitments made up not far from one-half of the total number (107) accredited to Kansas for the calendar year 1904 in the census report, and that the exclusion of these commitments would therefore make the ratio for 1904 about 3 instead of 6.1.

Adultery, fornication, and prostitution.—The three offenses of adultery, fornication, and prostitution have this feature in common, that they represent unlawful methods of gratifying the sexual instinct. But, as in the case of drunkenness, the number of commitments for these offenses depends quite as much upon the nature of the laws regarding them, the rigor with which these laws are enforced, and the penalties prescribed, as it does upon the prevalence of immorality and vice in the community. In a "wide-open" city, for instance, there may very well be a smaller ratio of commitments for prostitution in proportion

to population than in a city that is "closed up"; and in a city where this offense is ordinarily punished merely by the imposition of a fine there will naturally be fewer commitments than in a city where a jail sentence is the usual penalty. No one, therefore, is justified in using the ratio of commitments for these offenses as a basis for any very confident conclusions as to the relative degree of immorality in different states and communities.

The commitments for these offenses constituted 1.6 per cent of all commitments in 1910, representing a ratio of 8.3 per 100,000. In the geographic divisions the ratios ranged from 3.4 in the Pacific division to 14.4 in New England.

States having an exceptionally high ratio (above 20 per 100,000) were Massachusetts (20.1), Indiana (22.2), West Virginia (23.5), and Arizona (22.5). The states for which the ratio was exceptionally low (not over 2 per 100,000) were Maine (2), North Dakota (1.9), South Carolina (1.3), Georgia (1.7), Louisiana (1.8), New Mexico (0.3), and California (0.4). In each instance the list represents widely separated sections of the United States and a wide diversity as regards the general character of the population in such matters as the percentage urban, foreign born, or Negro, the predominance of manufactures or agriculture, and in other respects, all of which goes to confirm what has already been said regarding the probability that the ratios are not of much value as an index of the moral character of the population.

Drunkenness and disorderly conduct.—Drunkenness and disorderly conduct are often associated offenses, and for that reason it seems advisable to consider them in combination in presenting the data relating to commitments. Disorderly conduct is, however, a rather vague term the application of which by the courts varies in different communities. It may be used as a synonym for drunkenness, or may imply drunkenness, but that is by no means invariably the case. Very frequently, however, the two offenses were conjoined in the charge on which the prisoner was tried and convicted; but it should be explained that in tabulating the returns for this report all cases in which the offense was designated as "drunk and disorderly" were classified under drunkenness.

The proportion of the total number of commitments representing convictions for drunkenness or disorderly conduct varied among the geographic divisions from 31.7 per cent in the West South Central division to 68 per cent in New England, and among the states from 10.4 per cent in Mississippi to 77.6 per cent in Vermont. Of course, a relatively high percentage of commitments for these offenses may either mean that such commitments are of very frequent occurrence in the given state, or it may mean that commitments for other offenses are relatively infrequent. In the case of Vermont the high percentage of commitments for drunkenness results apparently from the fact that the number of commitments for offenses other than drunkenness was exceptionally small, which may be explained in part by the fact that the returns from that state did not include the state prison commitments. On the other hand, in Massachusetts, for instance, the high percentage for drunkenness or disorderly conduct in the total number of commitments is indicative of an exceptionally large number relatively of commitments for these offenses in that state as compared with other states.

In view of these considerations statistics showing the percentages of commitments for these offenses in the total number of commitments need to be interpreted by reference to the ratio of commitments to total population, which is shown in Table 19. In the United States as a whole there were 285.9 commitments for drunkenness or disorderly conduct to every 100,000 inhabitants, equivalent to a ratio of nearly 3 per 1,000. It may be said, therefore, that in a typical or average community of 1,000 population there would be 3 commitments for drunkenness or disorderly conduct in the course of one year. The ratios for the various geographic divisions ranged from 97.6 per 100,000 in the West South Central division to 539.3 per 100,000 in New England. The individual states exhibit a range of variation even more striking, the lowest ratio for any state being that for Mississippi, 21.1 per 100,000, and the highest being that for Arizona, 2,388 per 100,000.

Considerable interest naturally attaches to the showing made by the prohibition states, of which there were nine in 1910. Of these, four—North Dakota, Kansas, North Carolina, and Mississippi—had exceptionally low ratios, that for Mississippi, as already stated, being the lowest for any state. Two others—Alabama and Oklahoma—had ratios considerably below the average for the United States; two others, Georgia and Tennessee, ratios somewhat below the average; and one other, Maine, a ratio considerably above the average.

In this connection it may be well to emphasize what has already been said (p. 19) in the way of caution against accepting these percentages and ratios as indices of the relative prevalence of drunkenness in different communities. The preeminence of New England as regards the ratio of commitments for this offense would not justify the conclusion that there is more drunkenness there than in other sections of the country, although that may be the case; nor can the low ratio for the West South Central division be accepted as evidencing the sobriety of the population in that division. It is more probable that the variations in the ratios reflect differences of public policy in dealing with the given class of offenses, although, as already pointed out, there are many other factors which may affect the percentages, such as the proportion of the population living in cities, the proportion foreign born, and the proportion Negro, and of course the laws and regulations regarding the sale of alcoholic beverages.

What these statistics show is simply the amount of drunkenness or disorderly conduct punished by imprisonment. Of course, it is true that if drunkenness were entirely eliminated there would be no convictions and no imprisonment for that offense; and it is doubtless true that if other conditions remained the same the difference between different communities or different periods as regards the prevalence of this vice would be accompanied by a corresponding difference in the number of commitments. But as between any two states the conditions prevailing, however similar, are never quite the same. It is important to note in this connection the fact that of the total number of commitments for drunkenness or disorderly conduct over 70 per cent were cases in which the offender was committed for

nonpayment of fine. As, presumably, no one would choose to go to jail for this offense if he could afford to pay a fine and had that option, this suggests another factor which may affect the figures, namely, the degree of poverty prevailing in any class or community. A factor of greater importance, however, is the extent to which the sentence of a fine without imprisonment, as contrasted with the imprisonment sentence, is used in dealing with this offense. It is obvious that in a state or community in which the usual sentence for drunkenness is merely a fine a large proportion of those convicted of this offense would avoid imprisonment by payment of the fine, and therefore would not appear in the prison records, whereas in a community where imprisonment is the invariable penalty the commitments to prisons or jails would include practically all the convictions.

The ratios of commitments for drunkenness and disorderly conduct, as given in Table 19, indicate that there is a very wide variation in the law and practice of different states and communities regarding the punishment of these offenses; and since in the country as a whole they constitute more than one-half of the total number of commitments for all offenses it is evident that these variations to a large extent determine the variations in the total ratio of commitments. In order to eliminate the effect which these offenses have upon the totals, Table 20 has been prepared showing the ratio of commitments for all offenses other than drunkenness and disorderly conduct.

It will be found on comparing this table with the preceding one and also with Table 5 (p. 18) that the elimination of drunkenness and disorderly conduct from the list of offenses results in a closer approach to uniformity among the states in the ratio of commitments in proportion to population. As regards drunkenness and disorderly conduct there were six states in which the ratio of commitments was less than 100 and at the other extreme eight, including the District of Columbia, in which it was more than 500; but as regards all other offenses combined there were no states with a ratio of less than 100 and only four, including the District of Columbia, in which the ratio was more than 500. The ratio of commitments for offenses other than drunkenness and disorderly conduct was between 100 and 300 in 32 states, while the ratio of commitments for drunkenness and disorderly conduct was between these limits in only 23 states.

SUMMARY.

In the following table the prisoners and juvenile delinquents enumerated on January 1, 1910, and committed during the year 1910, respectively, are classified with reference to the general character of their sentence.

Table 21

NATURE OF SENTENCE.	PRISONERS AND JUVENILE DELINQUENTS: 1910.

[1] Less than one-tenth of 1 per cent.

Of the 493,934 prisoners and juvenile delinquents committed to penal or reformatory institutions in 1910, 278,914, or 56.5 per cent, were committed for nonpayment of fine. In the total number of prisoners and juvenile delinquents in confinement at any one time, however, the nonpayment class is relatively small, comprising on January 1, 1910, only 12,299, or about 9 per cent, of the 136,472 prisoners and juvenile delinquents who were in confinement on that date. This is due to the fact that the great majority of the prisoners in that class are convicted of minor offenses penalized by a small fine for which the alternative in default of payment is a short term of imprisonment, so that the accumulation of such prisoners at any one time must of necessity be small as compared with the number committed within a year.

It is a fair presumption that the prisoners committed for nonpayment of fine are with rare exceptions persons who are unable to pay a fine because of their poverty. Persons of means committing the same offenses usually pay their fines and therefore do not appear in the prison records. Thus, as an index of the number of convictions that result in punishment by fine, the prison statistics are obviously deficient, and that was apparently the reason why the nonpayment class was omitted from the prison census of 1904. Nevertheless, any enumeration of sentenced prisoners which leaves out this numerically important class is manifestly incomplete; and, moreover, in any consideration of the subject of penology as well as in other connections it is of interest to know the facts regarding this class of offenders who are subjected to imprisonment because they are too poor to pay a fine. Accordingly in the present census they have been included; but they have been separately tabulated so that they can be eliminated from the totals if for purposes of comparison or for any other reason it is desirable to show figures which do not include them.

A distinction introduced for the first time at the census of 1910 is that between prisoners sentenced to imprisonment only and those sentenced to imprisonment with the added penalty of a fine. In the latter case the length of the term of imprisonment obviously does not represent the full measure of the penalty, and, in fact, as is shown by figures to be presented later, a short term of imprisonment may be accompanied by a relatively heavy fine. In any classification of prisoners by length of sentence it is therefore desirable that the class of prisoners subjected to the added penalty of a fine should be distinguishable from those sentenced to imprisonment only. Of the prisoners and juvenile delinquents committed in 1910, 171,383 were sentenced to imprisonment only and 42,006 to imprisonment and fine. The former class accordingly comprised rather more than four times as many as the latter, the two classes constituting, respectively, 34.7 and 8.5 per cent of the total number of commitments. In the prison population (prisoners and juvenile delinquents enumerated January 1, 1910) the prisoners under sentence of imprisonment only were about nine times as numerous as those sentenced to imprisonment and fine.

The number of prisoners awaiting the execution of the death sentence on January 1, 1910, was 143, and the number committed under sentence of death during the year 1910 was 130. The fact that the number present on a given day is somewhat larger than the number committed in the course of one year suggests that on the average such prisoners remain in prison somewhat longer than one year. How many of them are finally executed the statistics do not show.

Table 22 gives the distribution by term of sentence of the prisoners sentenced to imprisonment, distinguishing those who were also fined from those sentenced to imprisonment only.

Table 22

LENGTH OF SENTENCE.	PRISONERS UNDER SENTENCE OF IMPRISONMENT: 1910. Total. Number.	Total. Per cent distribution.	Without fine. Number.	Without fine. Per cent distribution.	With fine. Number.	With fine. Per cent distribution.

Length of sentence not reported	763	0.4	479	0.3	284	0.7

[1] Includes life sentence. [2] Less than one-tenth of 1 per cent.

That the great majority of the malefactors annually sentenced to prisons, jails, and reformatories are guilty of minor offenses or misdemeanors punishable by short terms of imprisonment is clearly indicated by the above table. Of the total number committed under sentence of imprisonment in 1910, 32 per cent, or almost one-third, received a sentence of less than one month, 52.2 per cent (more than one-half) a sentence of less than two months, and 80.9 per cent (more than four-fifths) a sentence of less than one year. The percentage sentenced for a term of less than one year was somewhat greater for the class whose sentence included a fine than for the class sentenced to imprisonment only.

In the prison and jail population on a given day the relative number of long-term offenders is naturally much greater than among those committed during the year. Thus prisoners sentenced for a term of one year or longer formed 54.8 per cent of the prisoners under sentence of imprisonment in confinement on January 1, 1910, as compared with 11.1 per cent of the prisoners committed during the year.

Of the 98,791 prisoners in confinement on January 1, 1910, 21,083, or 21.3 per cent, were serving an indeterminate sentence; and of the 199,242 prisoners committed during the year 1910, 15,005, or 7.5 per cent, received an indeterminate sentence. The duration of such a sentence is usually defined within certain limits by designating a minimum and maximum term, although sometimes a maximum term only is indicated. The fact that the number of prisoners serving a sentence of this kind on January 1 was greater than the number receiving such sentences during the year indicates that the average duration of the indeterminate sentence is more than one year.

COMPARISON WITH PRIOR CENSUSES.

Table 23 gives the distribution by nature of sentence of the prisoners in confinement on a given date as enumerated at each census from 1880 to 1910, inclusive, in comparison with a similar distribution of the prisoners committed during the years 1904 and 1910. For the sake of comparability the figures are restricted to sentenced prisoners exclusive of those imprisoned for nonpayment of fine and those for whom the nature or length of sentence was not reported.

Table 23

SENTENCE.	SENTENCED PRISONERS EXCLUSIVE OF THOSE IMPRISONED FOR NONPAYMENT OF FINE AND THOSE FOR WHOM THE NATURE OR LENGTH OF SENTENCE WAS NOT REPORTED. Enumerated on— Jan. 1, 1910.	June 30, 1904.	June 1, 1890.	June 1, 1880.	Committed during the year— 1910	1904
	NUMBER.					
Total	98,916	81,273	66,604	43,165	198,609	145,562

Imprisonment for—						
Life	6,444	5,026	2,766	1,615	783	640
Definite term	71,112	63,762	63,653	41,470	182,641	136,146
1 year or over	47,704	43,679	45,115	30,310	21,357	20,017
Less than 1 year	23,408	20,083	18,538	11,160	161,284	116,129
Minority	134	.....	23	.....	50	.....
Indeterminate period	21,083	12,352	.....	.....	15,005	8,670
	PER CENT DISTRIBUTION.					
Total	100.0	100.0	100.0	100.0	100.0	100.0
Death	0.1	0.2	0.2	0.2	0.1	0.1
Imprisonment for—						
Life	6.5	6.2	4.2	3.7	0.4	0.4
Definite term	71.9	78.5	95.6	96.1	92.0	93.5
1 year or over	48.2	53.7	67.7	70.2	10.8	13.8
Less than 1 year	23.7	24.7	27.8	25.9	81.2	79.8
Minority	0.1	.....	(1)	.....	(1)	.....
Indeterminate period	21.3	15.2	.....	.....	7.6	6.0

[1] Less than one-tenth of 1 per cent.

The most significant change revealed by these figures results from the introduction and increasing use of the indeterminate sentence. This form of sentence was not reported at the censuses of 1880 and 1890, but made its first appearance at the census of 1904, when 15.2 per cent of the total number of prisoners enumerated as in confinement on June 30 were reported as serving indeterminate sentences. By 1910, the percentage receiving an indeterminate sentence had increased to 21.3, an increase which naturally was accompanied by a corresponding and nearly equivalent decrease in the percentage serving definite terms. The fact that most of this decrease, as may be noted, took place in the percentage sentenced for one year or more indicates that the indeterminate sentence is displacing the long-term definite sentence.

CLASS OF INSTITUTION.

Table 24 classifies by nature of sentence the prisoners and juvenile delinquents committed in 1910 to each class of institution.

Table 24 — PRISONERS AND JUVENILE DELINQUENTS COMMITTED IN 1910.

[1] Less than one-tenth of 1 per cent.

The prisoners who were imprisoned for nonpayment of fine were practically all committed to county or municipal jails, this class comprising 49.4 per cent of the total number of commitments to county jails and 80.9 per cent of the total for municipal jails. Of the prisoners committed to state prisons and penitentiaries, 89.1 per cent were sentenced to imprisonment only and 10.3 per cent to imprisonment and fine, while only an insignificant number were imprisoned for nonpayment of fine. Practically all the prisoners committed to reformatories were sentenced to imprisonment only.

In the classification by length of sentence (as given in Table 25) the prisoners sentenced to death and those committed for nonpayment of fine are not included, the tabulation being restricted to prisoners and juvenile delinquents committed under sentence of imprisonment either with or without fine. Of the total number of such prisoners 10.9 per cent were sentenced to a term of one year or more or for life, 45.8 per cent to a term of one month or more but less than one year, and 29.9 per cent to a term of less than one month. For 8.6 per cent of the total the sentence was indeterminate. The indeterminate sentence is the one usually imposed for prisoners committed to reformatories for adults, more than nine-tenths (93.9 per cent) of the total number committed to such institutions receiving this form of sentence; more than one-fifth (22.9 per cent) of those committed under sentence of imprisonment to state prisons and penitentiaries and about the same proportion (23.2 per cent) of those committed to juvenile reformatories also received an indeterminate sentence.

[1] Includes life sentence. [2] Less than one-tenth of 1 per cent.

The minority sentence, which is of course applicable only to juveniles, was reported in the case of 64.9 per cent, or nearly two-thirds, of the commitments to juvenile reformatories; and it is probable that in many of those cases where a definite term was reported for such commitments the period was really during minority, though stated as a definite number of years and months.

Of the prisoners committed to state prisons and penitentiaries under a sentence of imprisonment, more than two-thirds were sentenced for definite terms of one year or longer or for life, the exact percentage, as shown by Table 25, being 69.7. On the other hand, nearly all the commitments to county and municipal jails are for short terms, only 3.9 per cent of the total number committed to county jails and workhouses under sentence of imprisonment being sentenced to a definite term of more than one year, while in the case of the municipal jails the corresponding percentage was only 2.9. It should be borne in mind, furthermore, that the totals on which these percentages are based, being exclusive of commitments for failure to pay a fine, include only about one-half of the total number of prisoners committed to county jails and only about one-fifth of the total committed to municipal jails (see Table 24).

There are a few sporadic cases in which prisoners were reported as sentenced to imprisonment in county or municipal jails for life or a long term of years. The authenticity of such cases is, however, somewhat doubtful. County and municipal jails are very generally utilized as temporary places of detention for prisoners who have been convicted and sentenced to a long term of imprisonment in some state prison or penitentiary, to which they are ultimately transferred. All such prisoners should have been reported not from the jail but from the institution in which they were to serve their sentence; but it is not improbable that some prisoners of this class were nevertheless included in the reported commitments to the jails, and that this accounts for most if not all of the cases in which prisoners were reported as committed to such institutions for long terms.

The following table is restricted to prisoners committed for life or a definite term of imprisonment, whether with or without fine, and therefore does not include those receiving indeterminate sentences, nor does it include juveniles sentenced for their minority, or, for that matter, any juveniles committed to juvenile reformatories.

[1] Includes life sentence.

[2] Less than one-tenth of 1 per cent.

Of the prisoners sentenced to a definite term of imprisonment either with or without the added penalty of a fine, 34.8 per cent, or a little more than one-third, were sentenced to a term of less than one month, 21.9 per cent to a term of one month, 21.7 per cent to a term of from two to five months, and 9.6 per cent to a term of six months or more but less than one year. The proportion sentenced for a term of one year or longer or for life was 12.1 per cent, or about one-eighth. It should be noted that the various terms of sentence as here expressed include any fractional part of a year or month in excess of the number of years or months

specified. One month, for instance, represents any term from one month up to, but not including, two months; two to four years represents any term from two up to, but not including, five years.

Most of the prisoners committed to state prisons or penitentiaries for a definite period are sentenced for comparatively long terms, 90.5 per cent being sentenced to a term of one year or more and 29.6 per cent to a term of five years or more, including in each case those sentenced for life. In the case of the county jails, on the other hand, only 4 per cent of the prisoners committed for definite terms were sentenced for more than one year, and in the case of the municipal jails the proportion was even smaller, being only about 3 per cent. Of the prisoners committed to county jails under sentence of imprisonment for definite terms, 36.1 per cent, and of those similarly committed to municipal jails, 47.8 per cent, were sentenced for a term of less than one month. The proportions sentenced for less than two months for these two classes of institutions were, respectively, 59.4 per cent and 74.8 per cent.

As previously noted, most of the prisoners committed to reformatories for adults or for adults and juveniles receive indeterminate sentences. Of those receiving definite sentences the great majority are sentenced for moderately long terms, the proportion committed for terms of from one up to, but not including, five years being 86.1 per cent of the total. For the state prisons and penitentiaries the corresponding percentage was 60.9. On the other hand, the proportion committed for sentences of 10 years or more or for life was only 1.3 per cent in reformatories, as against 14.7 per cent in state prisons and penitentiaries.

GEOGRAPHIC DIVISIONS AND STATES.

Summary.—In two of the three preceding tables presenting statistics as to sentence by classes of institutions the totals included both prisoners and juvenile delinquents, the latter appearing in such tables as a separate class which may be readily segregated, by reason of the fact that the term "juvenile delinquents," as already explained, is simply a designation for the inmates of juvenile reformatories. In the tables which immediately follow, presenting figures for states and geographic divisions, juvenile delinquents are not included for the reason that a classification by term of sentence has little significance in relation to these inmates of juvenile reformatories, most of whom are sentenced for minority or for an indeterminate period. Their classification by term of sentence is, however, given by states in General Table 94 (p. 457).

Table 27 (p. 46) shows the per cent distribution by character and length of sentence of the prisoners committed in each geographic division and state. The numbers on which these percentages are based will be found in General Tables 5 (p. 313) and 71 (p. 428), or may readily be derived from these tables, the totals only being shown in Table 27.

The prisoners committed under sentence of death represent, as would be expected, only a small proportion of the total number of prisoners committed. In only one division, the South Atlantic, did they form as much as one-tenth of 1 per cent of the total number of commitments. The actual number of death sentences was almost as large in the Middle Atlantic division, but this division reported the largest total number of commitments and contains the largest population of any division.

In every division a large percentage of the prisoners committed belonged to the class of offenders who might have avoided imprisonment by the payment of a fine. The percentages were largest in the southern divisions, the maximum being that for the South Atlantic division (69.5); but in each of the other southern divisions the percentage was over 65. The lowest percentage (41.1) was that for New England. Although to some extent the percentages imprisoned for nonpayment of fine may reflect differences in the economic status of the offenders in different states as affecting their ability to pay a fine, it is more probable that it is determined largely by the practice of the courts and the provisions of the statutes in regard to the imposition of fines. In states where minor offenses are more commonly punished by fines than by prison or jail sentences, the relative number of prisoners imprisoned for nonpayment of fine will of course be larger than it is in other states.

The percentage sentenced to imprisonment and fine was exceptionally high in the East North Central and East South Central divisions (15.1 and 14.9, respectively); it was relatively high also in the West South Central division (11.9) and in New England (10). In each of the other divisions it was considerably lower, ranging from 4 in the West North Central division to 6.4 in the South Atlantic.

[1] Includes life sentence. [2] Includes sentence during minority. [3] Less than one-tenth of 1 per cent.

It may be noted that the classification by length of sentence in Table 27 includes all prisoners sentenced to imprisonment without distinguishing those sentenced to imprisonment only from those sentenced to imprisonment and fine. In other tables the length of the sentence is shown separately for these two classes and in the case of prisoners sentenced to imprisonment and fine it is shown in combination with the amount of the fine.

The prisoners sentenced to a definite term of one year or more or for life formed 4.6 per cent of the total number of prisoners committed in 1910 in the entire United States. For the geographic divisions the percentages ranged from 2 in New England to 12.3 in the West South Central division, and for the states from 0.1 in Washington to 18 in Mississippi. Representing the other extreme are the prisoners sentenced for a term of less than one month, who constituted only 1 per cent of the total number of prisoners committed in the state of Georgia as compared with 41.4 per cent of the total in the state of Nebraska. It is hardly possible to explain all these variations in the classification by length of sentence, as they are probably due to a variety of causes, the effect of which could be determined only by a detailed study of local conditions in the different states. Probably the factor which has the greatest influence is the manner of dealing with minor offenses or misdemeanors, such as drunkenness, vagrancy, and disorderly conduct. It is a question of the attitude of the community regarding such offenses, the frequency of their occurrence, the laws prescribing penalties, and the rigor with which the laws are enforced (see pp. 19, 33, and 39).

Prisoners committed under sentence of imprisonment.—In Table 28 the per cent distribution by term of sentence is shown by divisions and states for prisoners committed under sentence of imprisonment either with or without fine. The absolute numbers on which these percentages are based are derived from General Table 71 (p. 428).

The class sentenced to a definite term of one year or longer includes probably all the commitments for grave offenses with the exception of cases in which the sentence was death (not included in this table) or imprisonment for an indeterminate period. It includes, as already stated, about 70 per cent of the state prison commitments. The sentences of less than one month indicate the least serious offenses and cover probably a large proportion of the jail sentences for drunkenness. As regards the indeterminate sentence it is impossible to tell whether it indicates a grave offense or not, although probably it does in a majority of cases. In Massachusetts, however, one of the states making a very general use of the indeterminate sentence, it is applied to minor offenses, nearly all the offenders sent to the State Farm being committed for drunkenness, usually under an indeterminate sentence with a minimum of three months and a maximum of one year, and many of the women sent to the State Reformatory for Women being committed for drunkenness under an indeterminate sentence with a maximum of two years and no minimum.

[1] Includes life sentence.
[2] Less than one-tenth of 1 per cent.

Of the classes of prisoners here distinguished, the largest class in most states is that for which the sentence was a definite term of less than one year but not less than one month. In 21 states (counting the District of Columbia as a state) this class included more than one-half of the prisoners committed in the year 1910 under sentence of imprisonment, or in other words more than all the other classes combined, and in 9 other states it included more than any other one class. Among the remaining states there were 14 in which the largest class of prisoners committed consisted of those sentenced to a definite term of less than one month. In Iowa those receiving such sentences comprised 79.2 per cent of the total number of commitments under sentence of imprisonment, in Nebraska 67.1 per cent, and in South Dakota 59.7 per cent. For four states—South Carolina, Georgia, Arkansas, and Texas—the largest class was that for which the sentence was a definite term of one year or more, and in one state, Wyoming, it was the class receiving an indeterminate sentence. It should be borne in mind, however, that in many states the largest class in the total number of commitments was the class not included in the above table, namely, those committed for nonpayment of fine.

Among the several geographic divisions the percentage of prisoners sentenced to a definite term of one year or longer was largest in the West South Central, where 38.4 per cent, or almost two-fifths, of the prisoners committed under sentence of imprisonment were of this class. In the East South Central division the corresponding percentage was 26.2 and in the South Atlantic division 23.3. In Texas the proportion in this class was 51.9 per cent, or more than one-half; in Georgia and in South Carolina it was nearly 48 per cent; and in Arkansas 45.3 per cent. Outside the South the highest percentage shown for any division was that for the Mountain division (10.5), and the highest for any state that for Arizona (28.1). The percentage was only 3.4 in New England and was less than 1 in the states of Michigan, Idaho, Wyoming, and Washington.

The indeterminate sentence is evidently rather exceptional in the Southern states and this is perhaps one reason why the percentage of long-term definite sentences is high in those states. Kentucky is in fact the only Southern state from which any considerable number of indeterminate sentences was reported. In the other Southern states there were either none or only a few. There are also several states outside the South in which this form of sentence is either rare or unknown. The indeterminate sentence attained its greatest relative importance in Wyoming, where it was imposed upon 43.4 per cent of the total number of prisoners committed under sentence of imprisonment. The next largest percentage was that for Kansas (31.3) and the next that for Massachusetts (29.2). The absolute number of commitments for indeterminate sentences in Massachusetts, 15,264, was larger than that in any other state and included 35.8 per cent of the total number for the United States. It may be noted that where the percentage of indeterminate sentences is large the percentage of long-term definite sentences is usually small, thus indicating that the one form of sentence supersedes the other to a considerable extent, although, as already explained, the indeterminate sentence to some extent takes the place of the short-term sentence also, as in Massachusetts.

Comparison with census of 1904.—Table 29, presenting a classification by length of sentence of the prisoners committed under sentence of imprisonment in each geographic division, includes figures for 1904 as well as 1910. It is uncertain, however, how far the differences between the two censuses in the figures as tabulated represent changes which actually took place in the intervening period. As already stated, the census of 1910 was probably more complete, especially as regards the inclusion of county and municipal jails, than that of 1904, and this may be the main reason why the percentage of short-term prisoners among the total number of commitments as reported for the census of 1910 was considerably larger in most divisions and in the United States as a whole than it was at the census of 1904. The difference is especially marked in the southern divisions. In the South Atlantic division, for instance, the percentage sentenced for a term of less than one year was 74.5 in 1910, as compared with 59.5 in 1904; in the East South Central division the corresponding percentages were 70.8 and 49.8, respectively; and in the West South Central division, they were 59.2 and 42.4. In the New England and Middle Atlantic divisions there was not much change in the percentages sentenced for a term of less than one year, but there was a considerable increase in the percentage sentenced for less than one month, accompanied by a decrease in the percentage sentenced for one month or more but less than one year.

[1] Includes life sentence.
[2] Includes sentence during minority.
[3] Includes figures for United States penitentiary located in this division.
[4] Less than one-tenth of 1 per cent.

The percentage sentenced for a term of one year or more decreased in every division except the East North Central. The relative number of commitments for indeterminate sentences increased in the United States as a whole from 5.8 per cent of the total commitments under sentence of imprisonment in 1904 to 7.5 per cent in 1910. In the southern divisions there were comparatively few sentences of this class in either year. In the New England, Middle Atlantic, West North Central, and Pacific divisions the percentage increased; in the East North Central and Mountain divisions it decreased.

Imprisonment for life or definite term without fine.—Table 30 is confined to prisoners committed to imprisonment for life or for a definite term without fine. It comprises, therefore, the cases in which imprisonment was the sole and full penalty and excludes those in which the sentence was death or imprisonment and fine, or a fine followed by imprisonment for nonpayment, as well as those cases in which the term of sentence was indeterminate.

The large proportion of long sentences in the southern divisions is a noticeable feature brought out by this table. In the South Atlantic division 4.1 per cent of the prisoners committed under sentence for life or a definite term were sentenced for a term of 10 years or more or for life. In the East South Central division the percentage was 9.7 and in the West South Central it was 8. In the United States as a whole the percentage of sentences for 10 years or longer was only 1.7 and outside the South the highest percentage was 1.6 in the East North Central and Pacific divisions. The percentage sentenced for two years or longer was 16.9 in the South Atlantic division, 32 in the East South Central, and 46.3 in the West South Central; the highest percentage in any division outside the South was 7.9 for the Pacific division, while for the United States as a whole the percentage was 8.3.

The same general differences regarding length of sentence are shown by the column giving the approximate average length of sentence in months. Outside the South the average length of sentence ranged from 2.3 months in New England to 6.4 months in the Pacific division; but in the South Atlantic division the average was 13 months (or more than 1 year), in the East South Central it was 23.6 months (or nearly 2 years), and in the West South Central it was 28.8 months (or more than 2⅓ years).

While the contrast may indicate a tendency to impose longer sentences in the South for the same offenses, it more probably indicates relatively fewer commitments for minor offenses—a condition which might be in part a natural result of the fact that the South is largely rural. It may also mean that minor offenses are more commonly penalized by fines in the South than in the North, as is also suggested by the relatively large number of prisoners committed for nonpayment of fine in the South (see Table 27). Figures presented elsewhere show, for instance, that the total number of commitments included a smaller percentage of cases of drunkenness and disorderly conduct in the South than in other sections of the country (see Table 19); and this may indicate not only a relatively small number of arrests and convictions for these offenses, but the more general use of the fine as a penalty.

[1] Includes life sentence. [2] Less than one-tenth of 1 per cent. [3] Per cent not shown where base is less than 100.

Imprisonment and fine.—The total number of prisoners committed in 1910 under sentence of imprisonment with fine was 42,006. This represents 8.8 per cent of the total number of prisoners committed and 21.1 per cent of the number committed under sentence of imprisonment with or without fine. This form of sentence is very common in some states and very rare in others, as is evident from Table 31, which distinguishes prisoners sentenced to imprisonment only from those sentenced to imprisonment and fine and shows the percentage of the latter in the number sentenced to imprisonment.

As shown by Table 32 (p. 52), 12,833, or 30.6 per cent, of the 42,006 prisoners committed in 1910 under sentence of imprisonment and fine were sentenced for a term of less than one month and 29,383, or 69.9 per cent of the total, for a term of less than three months. For 13,274, or nearly one-third (31.6 per cent) of the total, the fine imposed was less than $10, and for 29,722, or 70.8 per cent of the total, it was less than $50. Considering the fine in combination with the length of the sentence, it appears that 5,998 of these prisoners, about one-seventh of the total number committed under sentence of imprisonment with fine, received a sentence of less than one month with a fine of less than $10; and that 23,105, or 55 per cent, received a sentence of less than three months with a fine of less than $50. It is evident, then, that as regards the great majority of these prisoners, the penalty is a short term of imprisonment and a small fine, indicating that this form of sentence is generally restricted to minor offenses.

There were, however, a number of long sentences and large fines. For instance, 2,631 of the prisoners receiving this form of sentence were sentenced for a term of one year or longer and 211 for five years or longer; 800 were fined $500 or more and 191, $1,000 or more; and 301 received a sentence of one year or more in addition to a fine of $500 or more. (See General Table 84, p. 442.)

The prisoners in each state committed under sentence of imprisonment and fine in 1910 are distributed in Table 33 according to the term of imprisonment and the amount of fine.

In most states a majority of the prisoners sentenced to imprisonment and fine were sentenced to a term of less than three months, accompanied by a fine of less than $50. In 12 states the largest of the various classes of prisoners distinguished in Table 33 was the class sentenced to a term of less than one month with a fine of less than $10; in 11 other states it was that sentenced to a term of less than one month with a fine of from $10 to $49; and in 9 others, that sentenced to a term of from one to two months, with a fine of from $10 to $49. The class for which the fine was $50 or more and the term of imprisonment either one to two months or three to eleven months was the largest class in Maine, North Dakota, Kansas, Georgia, Tennessee, Alabama, Oklahoma, Montana, and Nevada.

Table 33

PRISONERS COMMITTED IN 1910 UNDER SENTENCE OF IMPRISONMENT AND FINE.

In Table 34 (p. 54) the prisoners committed under sentence of imprisonment and fine in each geographic division are classified first with respect to length of sentence and then with respect to the amount of the fine. The exceptionally large percentage of long-term sentences and of indeterminate sentences in the Middle Atlantic division is the effect of conditions in Pennsylvania, where the long sentence or indeterminate sentence is very commonly combined with a fine. The imposition of a fine in connection with the indeterminate sentence is rather exceptional in other states. Of the 603 prisoners receiving a sentence of this character in the entire United States, 560 were reported from Pennsylvania.

Table 34

DIVISION.	PRISONERS COMMITTED IN 1910 UNDER SENTENCE OF IMPRISONMENT AND FINE.												
	Total.	Length of sentence.						Amount of fine.					
		Less than 1 month.	1 or 2 months.	3 to 11 months.	1 year or over.	Indeterminate.	Not reported.	Less than $10.	$10 to $19.	$20 to $49.	$50 to $99.	$100 or over.	Not reported.

[1] Less than one-tenth of 1 per cent.

Imprisonment for nonpayment of fine.—In General Table 85 (p. 448) the prisoners committed for nonpayment of fine are classified with respect to the amount of the fine. Table 35, which follows, gives the percentage in each class, by geographic divisions and states.

Table 35

DIVISION AND STATE.	PRISONERS COMMITTED IN 1910 FOR NONPAYMENT OF FINE.

[1] Less than one-tenth of 1 per cent.

Of the 278,914 prisoners committed because of inability or failure to pay the fine imposed as the penalty for the offense of which they were convicted, 129,713, or 46.5 per cent, had been fined less than $10, and 218,349, or 78.3 per cent, had been fined less than $20. Evidently, then, the great majority of these prisoners were convicted of some minor offense and could have avoided imprisonment by the payment of a small fine. The percentage fined less than $5 was largest (20.9) in the Middle Atlantic division and smallest (3.3) in the Mountain division. The percentage fined less than $10 was largest in New England (58.7), but was almost as large in the Middle Atlantic division (57.8); it was smallest in the West South Central division (34).

[1] Less than one-tenth of 1 per cent.

General Table 86 (p. 449), relating to prisoners committed for nonpayment of fine, classifies the prisoners according to the basis on which the sentence of a fine was changed to an equivalent prison sentence, or the allowance per day on fine; and Table 36, on page 55, gives the same classification on a percentage basis. In most states there appears to be no fixed or uniform relationship between the amount of fine and the term of imprisonment; but in many states there is, nevertheless, some one class which includes a large proportion or perhaps nearly all the prisoners committed for nonpayment. In Arizona, Utah, and California, for instance, nearly all these prisoners fall in the class for which the per diem allowance was from $1 to $1.24, inclusive. This probably means that the usual rule in these states is one day's imprisonment for $1 of fine. The other states in which not less than 50 per cent of the nonpayment prisoners were in this class were New Mexico (91.9 per cent), New York (86.2), Wyoming (83.7), Indiana (82.8), Kentucky (78.2), Arkansas (69.3), Nevada (60.8), Minnesota (59.2), Oklahoma (57.3), and West Virginia (50.2).

In Maryland nearly all and in Connecticut more than three-fourths of the total were in the class for which the allowance per day was from 75 to 99 cents.

The class for which the allowance was from 50 to 74 cents a day included more than 50 per cent of the total in Alabama (91.6 per cent), Florida (78.6), Massachusetts (76.1), Illinois (76), South Carolina (69.7), Vermont (65.9), Ohio (64.2), Georgia (53.2), and New Jersey (50.5).

The class allowed from 25 to 49 cents a day included 89.8 per cent of the total in the District of Columbia, 72.4 per cent in Tennessee, 67 per cent in Virginia, and 62.9 per cent in Maine.

In one state, Delaware, a majority of these prisoners received an allowance of only from 10 to 24 cents a day. In Iowa, on the other hand, a day's imprisonment was in 69.3 per cent of the total number of cases rated as equivalent to not less than $3 of fine; and in Montana, Idaho, Colorado, and Oregon, a majority of the prisoners served out their fines at the rate of from $2 to $2.99 a day.

In none of the other states—15 in all—did any one class include as many as one-half of the total number of prisoners committed for nonpayment of fine.

FOUR MAIN CLASSES.

In Table 37 (p. 57) the prisoners are divided into four main classes as follows: (1) Those receiving definite "long-term" sentences, which, as here defined, include sentences to death and to imprisonment for life or for a definite term of not less than one year; (2) those receiving definite "short-term" sentences or sentences to imprisonment for a definite term of less than one year; (3) those sentenced to imprisonment for an indeterminate period; and (4) those imprisoned for nonpayment of fine. The distinction between the "long-term" and "short-term" prisoners may be regarded as separating the prisoners convicted of serious offenses from those convicted of minor offenses, and the two classes might be designated, respectively, as major offenders and minor offenders. A difficulty arises, however, in applying this distinction to prisoners receiving an indeterminate sentence for the reason that, although in most states these seem to belong in the class of major offenders, that is not always the case. In Massachusetts in particular the indeterminate sentence, as already pointed out, is very commonly imposed for drunkenness and other minor offenses, and in a majority of such cases it probably results in imprisonment for less than one year. Accordingly, it seemed best to make a separate class of the prisoners receiving this form of sentence.

The table shows the percentage of the total number of prisoners in each class and also (in the last four columns) the ratio of the number in each class to the total population. For each class the ratios vary widely in the different states, these variations being determined largely by causes which have already been considered in connection with a table showing the ratio for all prisoners committed (see pp. 19 and 20).

It may be noted that in most states where there is a relatively high ratio of indeterminate sentences, the ratio of long-term definite sentences is relatively small, thus indicating the probability, already referred to, that the indeterminate form of sentence takes the place of the other to a considerable extent and that the class of prisoners receiving indeterminate sentences in such states corresponds to the class receiving long-term definite sentences in other states.

The ratio of long-term definite sentences is relatively high in most of the Southern states, as also in most of the far Western states (Mountain and Pacific divisions) with the exception of those having a relatively high ratio of indeterminate sentences. The low ratio of long-term definite sentences for the District of Columbia is explained by the fact that most of the offenders convicted of grave offenses in the District courts are committed to state or Federal prisons.

The ratio of definite short-term sentences is generally high in the New England, Middle Atlantic, Mountain, and Pacific states, and generally low in the North Central and Southern states. Several states, however, constitute exceptions to this general statement.

The ratio of commitments for nonpayment of fine varies greatly in each division. It is relatively high in most of the Mountain and Pacific states; but exceptionally high ratios as well as exceptionally low ratios are found in almost every division.

Table 37

PRISONERS COMMITTED IN 1910.

Division and state.	Total.	Sentenced for— Long term.[1] Number.	Long term. Per cent of total.	Short term. Number.	Short term. Per cent of total.	Indeterminate period. Number.	Indeterminate period. [1] Includes sentence to death, imprisonment for life, or definite term of 1 year or over.
[2] Includes sentence during minority.
[3] Less than one-tenth of 1 per cent.
[4] Less than one-tenth of 1 per 100,000.

SENTENCE AND OFFENSE.

CHARACTER OF SENTENCE.

In Table 38 the prisoners and juvenile delinquents committed for each offense are classified on a percentage basis according to the general nature and the term of the sentence imposed. The table shows, for instance, that of the 22,670 prisoners and juvenile delinquents committed for assault 39.1 per cent received a sentence of imprisonment only, and 18.5 per cent a sentence of imprisonment and fine, while 42 per cent were sentenced to pay a fine only, but were imprisoned for nonpayment. The absolute numbers on which these percentages are based will be found in General Tables 96, 99 and 100 (pp. 459, 466, and 478).

Table 38 — PRISONERS AND JUVENILE DELINQUENTS COMMITTED IN 1910.

OFFENSE.	Total.	Per cent of total.											
		Sentenced to death.	Sentenced to imprisonment.									Imprisoned for nonpayment of fine.	Nature of sentence not reported.
			Total.	Without fine.	With fine.	For life.	For definite term of— 1 year or over.	For definite term of— Less than 1 year.	For minority.	For indeterminate period.	For period not reported.

PROPORTION OF "NONPAYMENT" PRISONERS.

More than one-half (56.5 per cent) of the total number of commitments for all offenses, as shown in Table 38, represent cases of imprisonment for failure to pay a fine imposed as the penalty for the offense of which the prisoner was convicted. Those specific offenses or offense groups for which not less than 25 per cent of the commitments were for nonpayment of fine are given in the following list in order of rank as determined by the percentage:

Violating city ordinances	94.0
Gambling	81.7
Profanity	80.2
Nonobservance of Sunday	78.5
Trespassing	77.0
Violating fish and game laws	76.8
Cruelty to animals	75.8
Disorderly conduct	74.8
Unlawful discharge of weapons	72.9
Drunkenness	70.6
Prostitution	66.8
Obscenity	59.2
Resisting officer	58.9
Keeping house of ill fame	57.4
Cruelty to wife or child	57.3
Carrying concealed weapons	56.1
Fornication	55.5
Fraud	53.1
Violating contract	50.0
Nuisance	49.5
Illegal sale of drugs	49.0
Malicious mischief	42.6
Using property without permission	42.6
Assault	42.0
Adultery	39.9
Bastardy	39.9
Threat to do bodily harm	37.5
Vagrancy	36.8
Violating liquor laws	36.5
Contempt	28.8

The percentage imprisoned for nonpayment of fine does not of course indicate what proportion of the total number of persons convicted of the given offenses were fined, because it does not include those who paid their fine and thus avoided imprisonment. Nevertheless, the size of the percentage furnishes a clue to the relative frequency of the fine as the penalty for different offenses. Thus the fact that the percentage is highest for the group of offenses defined as violations of city ordinances indicates that the fine is more commonly imposed for this class of offenses than for any other; and the size of the percentage, 94, indicates further that a fine is the usual penalty and that direct imprisonment or jail sentences are rather exceptional.

The next highest percentages committed for nonpayment of fine were reported for gambling and profanity (81.7 and 80.2, respectively). For four other offenses the proportion was in excess of three-fourths, and for 12 it was one-half or over although less than three-fourths.

Table 39 shows by geographic divisions what percentage of the total number of prisoners (not including juvenile delinquents) committed for each of the specified offenses were imprisoned for nonpayment of fine. The list of offenses, it may be noted, includes all those for which the total number of commitments was not less than 1,000 and for which at the same time the number committed for nonpayment of fine was not less than 100.

[1] Includes figures for United States penitentiaries, which are not shown separately in this table.

[2] Per cent not shown where base is less than 100.

As between different divisions there is a rather wide range of variation in the percentage of commitments for nonpayment of fine shown for the same offense. In the case of drunkenness the percentage committed for nonpayment was 45.4 in New England, representing less than one-half of the total number of prisoners committed for this offense in that division, while in the West South Central division it was 94.3, or more than nine-tenths. It is evident, therefore, that the imprisonment sentence for drunkenness is much more usual in the former division than in the latter, and doubtless that is one reason, and perhaps the main reason, why the total number of commitments for this offense is relatively large in New England and relatively small in the West South Central division; for in all probability, where a fine is the usual sentence, a large proportion of the persons convicted of the offense pay the fine and so do not appear in the prison and jail records. To take some other instances, in the case of disorderly conduct the percentage imprisoned for nonpayment of fine was 51.1 in New England and 89.6 in the Mountain division; in the case of vagrancy it was only 1.8 in New England, as compared with 84.5 in the West South Central division; in the case of assault it was 15.7 in the Middle Atlantic division and 59.3 in the West South Central. Other comparisons can be made from inspection of the table. It is obvious that for many of these offenses the prison records come far short of accounting for the total number of convictions and for statistical purposes need to be supplemented by data obtained from the court records.

Table 40 shows by states the percentage committed for nonpayment of fine in the total number of prisoners committed respectively for assault, drunkenness, disorderly conduct, larceny, and vagrancy. These, it may be noted, are the leading offenses in respect to the total number of commitments. The numbers on which these percentages are based will be found in General Tables 39 and 43 (pp. 360 and 392). They do not, it should be noted, include juvenile delinquents, none of whom were committed for nonpayment of fine.

[1] Per cent not shown where base is less than 100.

In the state of Arkansas 99.6 per cent—in fact all but 4—of the 1,083 prisoners committed on the charge of drunkenness were fined and then imprisoned for nonpayment. It is evident that in this state a direct prison or jail sentence for drunkenness is very rare. At the other extreme is the state of New Hampshire, where only 32.8 per cent of the 1,032 prisoners committed for this offense were imprisoned for nonpayment of fine, the others (with the possible exception of 5 cases in which the nature of the sentence was not reported) being directly sentenced to imprisonment. It is probable, then, that the number of prison or jail commitments for drunkenness comes nearer to representing the total number of convictions for this offense in New Hampshire than it does in Arkansas. Suppose for purposes of illustration that in each state the

number of commitments for nonpayment of fine represented one-half the total number fined, the other half having paid the fine and thus avoided imprisonment. On that assumption the number of convictions for drunkenness in New Hampshire and Arkansas would be, respectively, 1,371 and 2,162, although the number of commitments was nearly the same in the two states, being, respectively, 1,032 and 1,083. This only emphasizes what has already been said regarding the futility of accepting the number of commitments as an index of the prevalence of drunkenness, since it is not even a reliable index of the number of convictions or amount of drunkenness punished. It represents only a minimum, showing that there were at least that number of cases of drunkenness, but giving no indication as to how many more there were.

The above assumption that the number imprisoned for nonpayment of fine represents one-half of the total number fined is, of course, purely arbitrary. The actual proportion may be much larger or much smaller. The writer knows of no statistics showing what a normal proportion would be, but in any event the larger the percentage imprisoned for nonpayment of fine in the total number of prisoners committed for the given offense, the more deficient is the number of commitments as an index of the total number of convictions.

The percentage of prisoners committed for nonpayment of fine in the total number of commitments for drunkenness was over 95 in Arkansas (99.6), Delaware (98.6), Georgia (97.1), South Carolina (96.7), Arizona (95.9), Colorado (95.7), Tennessee (95.7), and Texas (95.4). It was less than 50 in New Hampshire (32.8), Massachusetts (41.4), New York (42.9), Connecticut (45.3), and New Jersey (47.4). In the case of assault the percentage ranged from 11 in Pennsylvania to 87.5 in the District of Columbia; in the case of larceny, from 0.4 in Maryland to 85.7 in the District of Columbia; in the case of disorderly conduct, from 29.6 in Rhode Island to 99.4 in the District of Columbia; and in the case of vagrancy, from 0.3 in Maryland to 98.2 in Kansas. As regards the last-named offense an imprisonment sentence would appear to be very rare in Kansas and a sentence of a fine very rare in Maryland.

SENTENCED TO DEATH OR IMPRISONMENT.

As shown by Table 38, 12.2 per cent of the total number of prisoners and juvenile delinquents committed for grave homicide received a sentence of death and 72 per cent a sentence of imprisonment for life. In the case of lesser homicide there were 5 death sentences reported and 19 sentences to life imprisonment (see General Table 96, p. 459); but in view of the severity of the penalty it is probable that these cases were improperly returned or classified as lesser homicide. Of the total number committed for all homicides, 4.5 per cent received a death sentence and 25.9 per cent a sentence of life imprisonment. The only other offenses for which death sentences were reported were assault (2 cases), arson (1), and rape (3). Life sentences were imposed in a few instances for the offenses just mentioned and also for robbery, burglary, larceny, crime against nature, bigamy or polygamy, and fornication. It is quite probable, however, that some of these exceptional cases may represent an error in the returns regarding either the offense or the sentence.

The following statement shows what per cent of the prisoners committed for each specified offense were sentenced to death or to imprisonment for life or for a definite term of more than one year either with or without fine, the list of offenses including all those for which this percentage exceeded 10.

Grave homicide	97.3
Counterfeiting	80.4
Lesser homicide	74.5
Incest	55.3
Bigamy and polygamy	53.0
Forgery	52.0
Burglary	49.3
Rape	48.5
Arson	48.4
Perjury	47.7
Robbery	47.3
Crime against nature	45.5
Securing women for immoral purposes	36.5
Embezzlement	26.4
Violating election laws	24.0
Having stolen property	20.7
Truancy	19.7
Contributing to delinquency	18.5
Violating revenue laws	14.2
Larceny	13.6
Nonsupport	13.3
Escaping custody	12.6
Assault	11.8

The offense of grave homicide, as might be anticipated, heads the list, showing a percentage of 97.3. Next in rank come counterfeiting and lesser homicide, with percentages of 80.4 and 74.5, respectively. Then follow nine offenses—incest, bigamy and polygamy, forgery, burglary, rape, arson, perjury, robbery, and crime against nature—for which the percentage was below 60 but above 45. The percentage then drops to 36.5 for the offense of securing women for immoral purposes and to 26.4 for embezzlement. Truancy, for which the percentage was 19.7, may well seem out of place in this list of grave offenses; but of course the sentence in this instance is not a penalty and is therefore no index of the seriousness of the offense. Practically all of the juveniles committed for truancy are sent to reformatories, and while most of them are sentenced for their minority or else receive an indeterminate sentence, a considerable number are committed for a definite term of one or more years.

Table 41 gives the percentage distribution by length of sentence of those prisoners and juvenile delinquents who received a sentence of imprisonment either with or without fine. It does not, like Table 38, include in the total the prisoners committed for nonpayment of fine, nor does it include those sentenced to death.

Table 41

[1] Includes life sentence.

[2] Per cent not shown where base is less than 100.

White Table 38 shows the percentage which the prisoners and juvenile delinquents receiving a sentence of one year or longer formed of the total number committed, Table 41 shows the percentage which they formed of the total number committed under sentence of imprisonment. Of course, if the given offense is one for which a sentence of a fine only is rarely imposed, the two percentages do not greatly differ.[1] Thus the prisoners convicted of burglary and receiving a sentence of one year or longer or a life sentence formed 49.3 per cent of the total number committed for this offense (Table 38) and 50.4 per cent of the total number committed under sentence of imprisonment. On the other hand, in the case of assault the percentage committed for one year or longer was 11.8 when the total included all commitments for that offense, but becomes 20.5 when commitments for nonpayment of fine are excluded from the total. Accordingly, the rank of the offenses with respect to the percentage sentenced for one year or

[1] Except in the case of grave homicide, the percentage for which is affected by the omission of the death sentence.

longer based on the total commitments differs somewhat from that based on the total number receiving a sentence of imprisonment.

Table 41 indicates the relative frequency of the indeterminate sentence as applied to different offenses, as it shows what percentage received that form of sentence in the total number sentenced to imprisonment. Aside from offenses peculiar to children, for which an indeterminate sentence to juvenile reformatories is frequently imposed, the following are the offenses for which more than 20 per cent, or one-fifth, of the prisoners receiving a sentence of imprisonment were sentenced for an indeterminate period: Crime against nature (38.5 per cent), contempt (33.4), robbery (33.3), incest (32.1), forgery (30.4), burglary (29), bigamy (28.5), rape (28), having stolen property (25.2), arson (24.1), and lesser homicide (20.7). The list indicates that the offenses for which the indeterminate sentence is most frequently imposed are mainly crimes of a serious nature.

IMPRISONMENT WITHOUT FINE.

Table 42, showing for each offense the number and per cent distribution of commitments by term of sentence, is restricted to prisoners and juvenile delinquents sentenced to death or to imprisonment for life or a definite term without fine. The numbers on which the percentages are based are derived from General Table 96 (p. 459), which gives greater detail.

Table 42 — PRISONERS AND JUVENILE DELINQUENTS COMMITTED IN 1910 UNDER SENTENCE OF DEATH OR OF IMPRISONMENT FOR LIFE OR FOR A DEFINITE TERM WITHOUT FINE.

[1] Per cent not shown where base is not less than 100.

[2] Less than one-tenth of 1 per cent

In the following table the offenses or offense groups have been ranked with respect to the percentage receiving a sentence of one year or more, those offenses being omitted for which there were less than 100 commitments and also the offenses peculiar to children, the latter because the duration of the sentence has usually little relation to the gravity of the offense, since most of these offenders are committed to reformatories. The table shows also the percentage receiving a sentence of five years or more, and of one month or more, respectively, and it is apparent that the order of rank for either of these percentages differs considerably from the order as determined by the percentage sentenced for one year or longer. Nevertheless, the table may be regarded as affording a fairly satisfactory index of the relative gravity of the various offenses, reflecting the moral judgment of the community as interpreted by the legislators who frame the laws penalizing crimes and offenses and by the courts which apply these laws to specific cases.

[1] Includes sentence to death or life imprisonment.

[2] Less than one-tenth of 1 per cent.

IMPRISONMENT WITH FINE.

In Table 44 the prisoners committed under sentence of imprisonment and fine are classified according to the term of imprisonment and amount of fine so as to show for each specified offense the percentage in each class as thus defined by sentence. The table shows, for instance, that of the 8,039 prisoners convicted of drunkenness and receiving a sentence of imprisonment and fine, 50.7 per cent received a sentence of less than one month with a fine of less than $20 and 27.5 per cent received a sentence of from one to two months with a fine of the same amount. A detailed classification by length of imprisonment and amount of fine is given in General Table 99 (p. 466).

It should be remembered in this connection that the prisoners sentenced to imprisonment and fine usually represent only a small proportion of the total number of commitments for the given offense (see Table 38). The only offenses for which more than one-fourth of the total number of prisoners and juvenile delinquents committed received this form of sentence are counterfeiting (68.3 per cent), violation of revenue laws (51), violation of liquor laws (45.1), contributing to delinquency (36), nuisance (27.7), securing women for immoral purposes (26.1), and having stolen property (25.3). The list of offenses in the table here presented includes all those for which more than 100 of the prisoners committed received a sentence of imprisonment and fine.

Table 44

PRISONERS COMMITTED IN 1910 UNDER SENTENCE OF IMPRISONMENT AND FINE.

OFFENSE.	Total.	Sentenced to imprisonment for— Less than 1 month with a fine of— Less than $20.	$20 to $99.	$100 or over.	1 or 2 months with a fine of— Less than $20.	$20 to $99.	$100 or over.	3 to 11 months with a fine of— Less than $20.	$20 to $99.	$100 or over.	1 year or over with a fine of— Less than $20.	$20 to $99.	$100 or over.	Indeterminate period with a fine of— Less than $20.	$20 to $99.	$100 or over.	Length of sentence or amount of fine not reported.

FINES IMPOSED ON "NONPAYMENT" PRISONERS.

Table 45 gives the percentage distribution by amount of fine of those prisoners who were imprisoned for nonpayment of fine. The list of offenses includes all those for which there were more than 100 commitments of this class in 1910. The absolute numbers are given in General Table 100 (p. 478).

Of the total number of prisoners imprisoned for nonpayment of fine, 46.5 per cent were fined less than $10. For the prisoners of this class who were convicted of trespassing, the percentage was 67.8; for those convicted of drunkenness it was 62.3, and for those convicted of nuisance 52.4.

The percentage fined from $10 to $19, which was 31.8 in the case of all offenses combined, was largest (46.3) for prostitution; for cruelty to animals it was 43.8 and for vagrancy 42.6.

The percentage fined from $20 to $99 was 17.5 for the total, but was 61.6 for carrying concealed weapons, 60.4 for illegal sale of drugs, 57.4 for adultery, 56.5 for unlawful discharge of weapons, and 55 for burglary.

The percentage fined from $100 to $499 was only 2.5 for all offenses combined, but it was 41.7 for violating liquor laws, 30.3 for nonsupport, and 26.6 for illegal sale of drugs.

Only 0.1 per cent of the total were fined $500 or over, but the corresponding percentage for bastardy was 48.6, and for threat to do bodily harm 7.4. It is doubtful whether in the case of bastardy the amount here specified always represented a fine in the ordinary sense of the term. Probably in many cases it represents wholly or in part the amount which the person convicted was ordered by the court to provide for the care of the child.

45 to 54 years	8,369,988	9.1	56,230	11.4	671.8
55 to 64 years	5,054,101	5.5	22,408	4.5	443.4
65 years or over	3,949,524	4.3	7,718	1.6	195.4
Age not reported	169,055	0.2	53,241	10.8	.....

The prisoners and juvenile delinquents committed under sentence on conviction of some crime or misdemeanor naturally include comparatively few young children. Nevertheless, the above table shows that there were 568 committed under 10 years of age, and 9,061 from 10 to 14 years of age, representing, respectively, 0.1 and 1.8 per cent of the total number committed. Most of these young children, as will be shown by figures presented in another connection, were committed to juvenile reformatories (see General Table 33, p. 348).

The number of prisoners and juvenile delinquents who were under 21 years of age was 61,119, representing 12.4 per cent, or about one-eighth, of the total number committed. The number from 21 to 44 years of age formed 59.4 per cent of the total, and the number 45 or over 17.5 per cent. It may be noted that the number reported in the several age groups falls somewhat short of the true number, because in many cases the age was not reported, such cases constituting in fact 10.8 per cent of the total number of commitments.

In the above table the age distribution of the prisoners and juvenile delinquents may be compared with that of the general population. The contrast arises mainly from the fact that the former, as already noted, include comparatively few young children. Thus, while only 1.9 per cent of the prisoners and juvenile delinquents were under 15 years of age, the proportion of the total population below that age was 32.1 per cent, or almost one-third. At the same time the proportion of old people is smaller in the prison commitments than in the total population, the percentages 65 or over being, respectively, 1.6 and 4.3 and the percentages 55 or over being 6.1 and 9.8. But from 18 up to 54 the percentage in each age group is larger in the case of the prison commitments, the aggregate number within these age limits representing 78 per cent of the prisoners and juvenile delinquents committed, as compared with 52.1 per cent of the total population.

The last column of the table shows the ratio of commitments in each age group per 100,000 population of the same age. For the group under 10 years of age the ratio of commitments to total population (2.8 to 100,000) has very little significance, as the great majority of children under 10 are too young to be capable of committing offenses which come within the cognizance of the courts. Since the 568 children committed when under 10 years of age could not have been much below that age, the only significant comparison would be one by single years of age, the figures for which are not available.

The 710 commitments of children who were 10 years old represent a ratio of 38 to each 100,000 children of that age. The ratio advances rapidly with each successive year of age, reaching 701.2 per 100,000 at the age of 19. The reduction of the ratio to 663.3 in the next year of age not improbably results from errors in the stated age of the prisoners committed.[1] The ratio reaches its maximum in the group "21 to 24 years," for which it was 891.7 per 100,000, and in the two following groups, covering the ages from 25 to 44, inclusive, it shows only a slight decline. After the age of 44, however, it falls off markedly, the number of commitments per 100,000 population being 671.8 in the age group "45 to 54," 443.4 in the group "55 to 64," and 195.4 in the group 65 years of age or over.

[1] The reader not familiar with age statistics may wonder why there is any more probability of error at this point in the age scale than elsewhere. One reason is that many persons, and especially males who are in their twenty-first year, either through ignorance or for other reasons give their age as 21 instead of 20. The number thus overstating their age may very well be proportionately larger among prisoners than in the general population. It is also very probable that prisoners in this period of life may often claim to be younger than they really are with the hope of receiving a more favorable sentence from the courts. The main reason, however, for assuming error of some sort in the age returns is the improbability that the ratio of commitments is actually smaller at the age of 20 than it is either at the age of 19 or at the ages from 21 to 24, inclusive.

GEOGRAPHIC DIVISIONS.

Generalizing from the figures for the entire United States, it may be said that the frequency of lawbreaking increases rapidly in the period of youth up to the age of about 21, shows little change for the next 25 years, and falls off with the approach of old age. The figures for the several geographic divisions, however, presented in Table 47, do not bear out this generalization in all particulars, although in every division the ratio increases rapidly in youth and declines in old age. In New England, for instance, the ratio, instead of being practically stationary between the ages of 21 and 44, continues to increase very materially in each successive age group up to the group "35 to 44 years." In each of the three southern divisions, on the other hand, the ratio reaches its maximum in the age group "21 to 24" and decreases materially in each older group. This is also true of the Pacific division. In the other divisions the ratio within the groups comprising persons 21 to 44 years of age shows no marked tendency towards either an increase or decrease, but is more nearly stationary, as in the case of the United States as a whole. It may be noted, however, that an exceptional condition prevails in the Middle Atlantic division, where the ratio for the age group "25 to 34" is for some reason considerably smaller than it is for either the next younger or the next older age group.

[1] Includes figures for United States penitentiaries, which are not shown separately in this table.

CLASS OF INSTITUTION.

Table 48 gives the classification by age of the prisoners committed to each class of institutions and of the juvenile delinquents committed to reformatories for juveniles.

Of the prisoners committed to state prisons, 72.3 per cent were under 35 years of age, as compared with 49.4 per cent of those committed to county jails and 47.3 per cent of those committed to municipal jails. The percentages under 25 years of age for these three classes were, respectively, 37.7, 22.3, and 20.9, and the percentages under 21 were 16.2, 9.4, and 8.2. Thus the prisoners committed to state prisons and penitentiaries are as a class considerably younger than those committed to county or municipal jails. This difference in age is largely explained by the difference in the class of offenses which they represent. In a very large proportion of the county and municipal jail commitments the offense is drunkenness, and as will be shown by statistics presented later, the prisoners committed for this offense are older as a class than the prisoners convicted of more serious offenses.

It may be noted that the percentage 45 years of age or over was considerably greater among the prisoners committed to county jails (20.8) than among those committed to municipal jails (15.1), but this apparent difference is partly due to the fact that the proportion whose age was not reported was much larger for the latter (18.6 per cent) than for the former (7.3 per cent). If the percentages were based on the total number of prisoners whose ages were reported, the percentage 45 or over would become 22.4 (instead of 20.9) in the case of the county jail commitments, and 18.6 (instead of 15.1) in the case of municipal jail commitments. It is probable that this difference is mainly caused by the difference in age composition

between the country and city population. The prison and jail inmates are recruited mostly from the adult male population of the community; and of the total male population 15 years of age or over, 30.2 per cent were 45 years of age or over in rural communities, as compared with 26.2 per cent in urban communities. While it is true that many of the county jails are located in large cities in which there are no municipal jails and that on the other hand many municipal jails are located in small places classed in the census as rural, nevertheless the population represented by the municipal jails is mainly urban and that represented by the county jails is largely rural.

[1] Includes figures for United States penitentiaries, which are not shown separately in this table.
[2] Less than one-tenth of 1 per cent.

Of course, practically all the offenders committed to reformatories exclusively for juveniles were under 21 years of age, and it is noticeable that a majority (54.1 per cent) of those committed to reformatories for adults or for adults and juveniles were also under 21.

Of the total number of offenders under 18 years of age committed to all penal or reformatory institutions, 53.1 per cent, or a little more than one-half, were committed to juvenile reformatories, 4.5 per cent to other reformatories, 24.9 per cent to county jails, 13.9 per cent to municipal jails, and 3.6 per cent to state prisons. The absolute number of offenders under 18 years of age committed to prisons or jails in the year 1910 was 10,775; the number committed to reformatories was 14,647.

OFFENSE.

Table 49 indicates by percentages the age distribution of the prisoners and juvenile delinquents committed for each specified offense, the list of offenses including all those for which there were more than 900 commitments.

Table 49 — PRISONERS AND JUVENILE DELINQUENTS COMMITTED IN 1910, EXCLUSIVE OF THOSE WHOSE AGE WAS NOT REPORTED.

OFFENSE.	Total.	Per cent of total.

[1] Less than one-tenth of 1 per cent.

Of the total number of prisoners and juvenile delinquents committed in 1910 (excluding those whose age was not reported), 5.8 per cent were under 18 years of age and 28.4 per cent, or more than one-fourth, were under 25 years of age. Naturally those under 18 included practically all the prisoners or juvenile delinquents who were committed for truancy, delinquency, and incorrigibility. Leaving these distinctly juvenile offenses out of consideration, the percentage of youthful offenders was highest among the prisoners committed for burglary; of the burglars committed in 1910, 18 per cent were under 18 years of age and 60.5 per cent were under 25 years of age. The offense next in importance among those distinguished in the above

table as regards the proportion of youthful offenders committed is that of larceny, 15.2 per cent of the persons committed for that offense being under 18 years of age and 50 per cent being under 25 years. The percentage under 25, however, was not as high for larceny as for robbery, fraud, injuries to common carriers, and trespassing, because the commitments for each of these four offenses comprised an exceptionally high percentage between 18 and 25 years of age.

The proportion of offenders committed who were between the ages of 25 and 35 was exceptionally high in the case of adultery, assault, embezzlement, gambling, homicide, keeping a house of ill fame, nonsupport, and prostitution, the percentage for these offenses ranging from 35.5 for lesser homicide to 39.9 for adultery, while for all offenses combined it was only 29.5.

Broadly speaking, the oldest class of offenders consists of those committed for drunkenness, the proportion 45 years of age or over among those committed for that offense being 31 per cent. The percentage 45 or over was relatively high also among those committed for vagrancy (22.6), contempt (22.1), violation of liquor laws (21.7), obscenity (19.1), and nonsupport (17. 3), while for the other classes of offenses distinguished in Table 49 it ranged from 2.4 in the case of robbery to 16.7 in the case of disorderly conduct.

In Table 49 the commitments in each of the principal offense classes were distributed on a percentage basis by age; in Table 50, which follows, the commitments in each age group are distributed on a percentage basis by offense. Of course, the two distributions reveal to a certain extent the same facts but from different points of view.

Of the 25,422 youthful offenders committed under 18 years of age, 7,502, or 29 per cent, were convicted of distinctly juvenile offenses, 2,927 being committed for incorrigibility, 1,952 for delinquency, 1,552 for truancy, 809 for dependency, and 262 for two or more juvenile offenses or for certain other juvenile offenses which are not shown separately in Table 50, but are included under "All others" in General Table 44, page 400; 23.7 per cent were convicted of larceny; 11.7 per cent of disorderly conduct; 6.7 per cent of vagrancy; and 6.1 per cent of burglary.

In the case of the older age groups the most striking change is the increase shown by each successive group in the percentage of commitments for drunkenness. This percentage increases from 1.5 in the group under 18 years of age to 14.6 in the group "18 to 24," 32 in the group "25 to 34," 46.2 in the group "35 to 44," and 52.9 in the group "45 to 54." Thereafter there is not much further increase, the percentage remaining nearly stationary. Of course, the great increase in the relative importance of this class of commitments in the older age periods involves a corresponding decrease in the relative importance of the commitments for all other offenses taken collectively; and in fact the only other offense distinguished in the above table for which the percentage shows an increase in the later years of life is vagrancy.

[1] Less than one-tenth of 1 per cent.

In each of the four age groups between 18 and 55 about 10 per cent of the total number of commitments were for vagrancy; but in the age group "55 to 64" the percentage was 13.5 and in the oldest group, "65 or over," it was 15.9. Of the total number of commitments of persons 55 years of age or over to prisons, jails, or reformatories in 1910, about 68 per cent were for drunkenness or vagrancy; but of the total number of commitments of persons from 18 to 24 years of age, only 25.2 per cent were for these offenses. This difference may mean that as each generation grows older the prevalence of drunkenness and vagrancy among its members increases, while the commission of other offenses decreases; or it may be that both increase or that both decrease, the change in the proportion resulting from the fact that they do not increase or decrease to the same extent. Some further light upon the situation may be obtained by comparing the number of commitments for each class of offenses in each age group with the total population of the same age, the ratio of commitments to the total population furnishing an index of the frequency of the occurrence of the various offenses in so far as they result in prison or jail commitments. Comparisons of this kind may be made upon the basis of the figures presented in the following table, which shows for each of the principal offenses the number of commitments in each age group per 100,000 population of the same age. In this table the data are presented by single years of age from the age of 15 up to and including that of 20, because it is believed that in this period of life, covering the transition from childhood to manhood, the changes in the ratios are of special interest. Beyond the age of 20 the data were not tabulated by single years, but only by age groups.

[1] Includes those whose age was not reported.

[2] Less than one-tenth of 1 per cent.

For burglary, forgery, fraud, larceny, rape, and trespassing, the ratio of commitments reaches its maximum at the age of 19, that is to say, there are more commitments for these offenses relatively in the population of that age than in any younger or older age groups. For most of the other offenses the maximum ratio of commitments falls in the age group "21 to 24." The only important exception other than juvenile offenses is drunkenness, for which the ratio of commitments continues to increase until the maximum is reached in the age group "35 to 44." In the next older age group, "45 to 54," the decline in the ratio for drunkenness is less marked than that in the ratio for all other offenses combined, as shown in Table 52; but thereafter there is not much difference in the rate of decline in the ratio of commitments between drunkenness and all other offenses combined.

Table 52

AGE.	PRISONERS AND JUVENILE DELINQUENTS COMMITTED IN 1910.				
	Total.	For drunkenness.		Ratio per 100,000 population of same age.	
		Number.	Per cent of total.	For drunkenness.	For all other offenses.
All ages	493,934	170,977	34.6	185.9	351.1
Under 15 years	9,629	26	0.3	0.1	32.6
15 to 17 years	15,793	351	2.2	6.5	287.4
18 to 20 years	35,697	3,140	8.8	56.6	587.0
21 to 24 years	64,221	11,462	17.8	159.1	732.5
25 to 34 years	129,974	41,619	32.0	274.7	583.1
35 to 44 years	99,023	45,748	46.2	392.4	457.0
45 to 54 years	56,230	29,722	52.9	355.1	316.7
55 to 64 years	22,408	12,145	54.2	240.3	203.1
65 years or over	7,718	4,087	53.0	103.5	91.9
Age not reported	53,241	22,677	42.6	.....	.....

Generalizing, it might be said that these statistics indicate that the tendency toward the commission of most offenses diminishes steadily after the age of 25, but that drunkenness is an offense which occurs with increasing frequency until the age of 45 is passed and for a time thereafter shows a slower rate of decrease than other offenses. The precise significance of these variations in the ratios for the successive age groups is not, however, altogether obvious or certain. While it is probable that they reflect the changes taking place in the habits of each generation as it grows older, it is possible that they may be affected by a permanent difference in education, standards, habits, racial composition, or other respects between the older generation which is passing off the stage of life and the younger generation which is coming up to take its place. As regards the use of alcoholic drinks, it is very probable that the present younger generation is more temperate than the older generation ever was. At the same time it is also probable as regards the individual who is intemperate that drunkenness becomes more habitual and occurs with greater frequency as he grows older. The decline in the ratio of commitments for drunkenness after the period of middle life may result from a high degree of mortality among inebriates as compared with the rest of the population.

SENTENCE.

Attention has been called to the fact that more than one-half (56.8 per cent) of the total number of prisoners and juvenile delinquents committed in 1910 were sentenced to pay a fine and were imprisoned for nonpayment. This class of prisoners is shown by age groups in Table 53, including, however, the comparatively small number (1,501) of prisoners committed for whom the nature of sentence was not reported. These are included simply because the tabulation of the data by age in relation to sentence was not sufficiently detailed to make it possible to eliminate them.

Table 53

AGE.	PRISONERS AND JUVENILE DELINQUENTS COMMITTED IN 1910.		
	Total.	Imprisoned for nonpayment of fine.[1]	
		Number.	Per cent of total.
All ages	493,934	280,415	56.8
Under 15 years	9,629	696	7.2
15 to 17 years	15,793	5,384	34.1
18 to 20 years	35,697	18,634	52.2
21 to 24 years	64,221	36,139	56.3
25 to 34 years	129,974	75,300	57.9
35 to 44 years	99,023	57,668	58.2
45 to 54 years	56,230	31,336	55.7
55 to 64 years	22,408	11,912	53.2
65 years or over	7,718	4,126	53.5
Age not reported	53,241	39,220	73.7

[1] Includes 1,501 prisoners and juvenile delinquents for whom the nature of sentence was not reported.

Among the youthful offenders under 15 years of age the percentage imprisoned for nonpayment of fine was comparatively small (7.2), doubtless because a fine is not often imposed for the class of offenses of which they were guilty. The percentage was considerably larger (34.1) in the succeeding age group, "15 to 17 years." In the older groups the percentage exceeded 52, reaching its maximum in the age group "35 to 44," where it was 58.2. The highest percentage of all, however, was that for the group designated "Age not reported" (73.7), a fact which indicates simply an exceptional degree of indifference or negligence in obtaining and recording personal data for the nonpayment prisoners.

In Table 54 the prisoners and juvenile delinquents sentenced to death or to imprisonment either with or without fine are classified by age groups and term of sentence. The proportion of short-term sentences (less than one year) increases with the advance in age, doubtless because, as indicated by Table 50, the commitments for drunkenness and vagrancy—offenses commonly punished by relatively short terms of imprisonment—form an increasing proportion of the total number of commitments at the older ages.

[1] Less than one-tenth of 1 per cent.

The proportion of indeterminate sentences is largest, over 20 per cent, in the two youngest age groups, and diminishes thereafter up to the age group "25 to 34." After that the percentage remains nearly constant, at a little over 6, up to the age of 65. It declines to 3.5 in the age group "65 or over."

The sentence to imprisonment during minority is of course confined to the age groups below 21. Of the juveniles under 15 years of age, 60.5 per cent were sentenced for their minority. The percentage in the next older age group, 15 to 17, is much lower, being only 33.3.

As shown by Table 54, 43.1 per cent, or more than two-fifths, of the prisoners sentenced to death were from 25 to 34 years of age, this percentage being much larger than the corresponding percentage for any other sentence class. For the prisoners receiving a sentence to imprisonment for life or for a definite term of not less than 10 years the percentage between 25 and 34 was a little over 33. The percentage between 35 and 44 was larger for those sentenced to death than for any other class except those sentenced for less than one year.

Table 55, showing the per cent distribution by age of the prisoners and juvenile delinquents as classified by sentence, excludes those whose age was not reported. It distinguishes only three age groups, but shows the median age and gives the classification by sentence in detail.

Excluding those sentenced for their minority (all of whom were of course under 21 years of age) and those for whom the length of sentence was not reported, the percentage under 21 years was highest (37.1) for those who received an indeterminate sentence; it was also relatively high (over 22) among those who received a sentence of not less than 2 nor more than 9 years. The percentage from 21 to 44 years of age was highest (80.2) for those who were sentenced to death. For those sentenced to life imprisonment it was 75.3 and for those sentenced for a definite term of not less than 20 years it was 74.2. The percentage 45 years of age or over was relatively high among those sentenced to imprisonment for less than 4 months.

The "median age" is the term used to designate that age which separates any class of population into two numerically equal groups, one consisting of those who are above that age and the other of those who are below it. Thus one-half of the total number of prisoners and juvenile delinquents committed in 1910

under sentence of death or imprisonment, excluding those whose age was not reported, were over 31.4 years of age and one-half were below that age.[1] For those prisoners and juvenile delinquents who were sentenced to imprisonment for terms of less than 4 months, the median age was not far from 34, while for those who were sentenced to terms of from 3 to 9 years it was about 27 and for those sentenced to death or to imprisonment for 10 years or longer or for life it was about 29. Of course, the median age of those sentenced for their minority was very much lower, being in fact 14.5 years, and the median age of those receiving an indeterminate sentence (24.5 years) was lower than that of any of the other classes except the class sentenced for their minority and the class whose sentence was not reported.

[1] The median age here given is necessarily approximate, because the age tabulation was not made in sufficient detail to permit of an exact computation. From the available figures the age group in which the median age falls can be definitely ascertained and its exact position was estimated on the assumption of an even distribution by single years of age of the total number of prisoners in that group.

Table 55 — PRISONERS AND JUVENILE DELINQUENTS COMMITTED IN 1910 UNDER SENTENCE OF DEATH OR IMPRISONMENT, EXCLUSIVE OF THOSE WHOSE AGE WAS NOT REPORTED.

Table 56, showing in months the approximate average length of sentence, is restricted to prisoners and juvenile delinquents committed under sentence of imprisonment for definite terms either with or without the additional penalty of a fine. It shows an almost uninterrupted decrease in the average length of sentence with each advance in age, which is consistent with the facts brought out by Table 54.

Table 56 — PRISONERS AND JUVENILE DELINQUENTS COMMITTED IN 1910 FOR A DEFINITE TERM OF IMPRISONMENT.

AGE.	Number.	Approximate average length of sentence in months.
All ages	183,956	6.4
Under 10 years	71	36.9
10 to 14 years	1,277	21.3
10 years	80	31.0

45 to 54 years	23,155	4.3
55 to 64 years	9,741	3.7
65 years or over	3,455	3.6
Age not reported	13,515	2.7

The longer terms for juveniles doubtless represent the commitments to reformatories, in which cases the sentence is regarded not as a penalty to be adjusted to the gravity of the offense, but as an opportunity for the education and reform of the offender. It should be remembered that these averages are based on sentences for definite terms and do not, therefore, include the great majority of juvenile offenders, who are sentenced either for their minority or for an indeterminate period.

The 136,472 prisoners and juvenile delinquents enumerated January 1, 1910, as shown in Table 57, included 12,048 females, and the 493,934 prisoners and juvenile delinquents committed during the year 1910 included 48,566 females. Thus of the prisoners and juvenile delinquents enumerated 8.8 per cent were females, and of those committed 9.8 per cent. In the one case there were about 10, in the other about 9 males to 1 female.

The ratio of commitments for males, by which is meant the number of males committed per 100,000 male population, was 940.9; the corresponding ratio for females was 108.8. In proportion to their numbers, therefore, there were about nine times as many commitments among males as among females.

Table 57

SEX.	PRISONERS AND JUVENILE DELINQUENTS: 1910.				
	Enumerated January 1.		Committed during the year.		
	Number.	Per cent distribution.	Number.	Per cent distribution.	Ratio per 100,000 population of same sex.

Female	12,048	8.8	48,566	9.8	108.8

GEOGRAPHIC DIVISIONS AND STATES.

The next table shows for each geographic division and each state the number of males and females and the percentage of females in the total number of prisoners and juvenile delinquents enumerated January 1, 1910, and also in the total number committed during the year 1910.

The percentage of females in the prison population (prisoners and juvenile delinquents enumerated Jan. 1, 1910) was largest in New England (13.5 per cent), but it was almost as large in the East North Central division (12.5 per cent). In the other two northern divisions, the Middle Atlantic and West North Central, the percentage of females in the prison population was about 10, or more exactly 10.6 and 9.8, respectively. In the South and West the percentages were much lower, ranging from 3.1 in the West South Central division to 7.1 in the South Atlantic.

The percentage of females in the total number of prisoners and juvenile delinquents committed during the year was in some divisions larger, in other divisions smaller, than that in the total prison population, and the rank of the several divisions according to one percentage was very different from that according to the other. The highest percentages of females among the commitments were those for two southern divisions, the South Atlantic and the East South Central. The fact that in these divisions the percentage of females was higher among the commitments than in the prison population indicates that the average term of sentence is shorter for females than for males. On the other hand, the percentages for New England and the two North Central divisions indicate a longer period of imprisonment for females than for males. This, however, may result simply from the fact that so large a proportion of the female offenders and delinquents are girls committed to juvenile reformatories, where they usually remain during their minority.

Table 59 gives the ratio of commitments for each sex, by which is meant the number of prisoners and juvenile delinquents of each sex committed per 100,000 population of the same sex. The last column, under the designation of "Coefficient of difference," gives the quotient which results from dividing the ratio of commitments for males by that for females. It shows, for instance, that in the United States as a whole the ratio of commitments for males was 8.6 times that for females, or in other words that in proportion to their numbers in the total population there were 8.6 times as many males committed as females.

Table 59

DIVISION.	RATIO OF COMMITMENTS.[1]		
	Males.	Females.	Coefficient of difference.
	A	B	A÷B
United States	940.9	108.8	8.6
New England	1,453.4	137.2	10.6
Middle Atlantic	1,030.3	146.7	7.0
East North Central	835.0	78.7	10.6
West North Central	803.6	65.4	12.3
South Atlantic	929.3	163.0	5.7
East South Central	751.5	115.9	6.5
West South Central	546.5	52.7	10.4
Mountain	1,470.8	91.0	16.2
Pacific	1,392.4	83.4	16.7

[1] Number of prisoners and juvenile delinquents committed in 1910 per 100,000 population of the same sex.

Comparing the ratio of commitments by geographic divisions it will be found, as would be expected, that in every division the ratio is much higher for males than for females. The difference is most marked in the Mountain and Pacific divisions, where, as shown by the coefficient in the above table, the ratio of commitments for males is more than 16 times that for females; in the South Atlantic and East South Central divisions, on the other hand, the one ratio is only about 6 times the other.

In the case of females it is rather remarkable that the highest and the lowest ratios should both be shown for southern divisions—the South Atlantic and West South Central, respectively. In the case of males the lowest ratio is also that for the West South Central division, but the highest is that for the Mountain division, which, however, is only slightly higher than the ratios for the New England and Pacific divisions.

CLASS OF INSTITUTION.

In Table 60 the prisoners and juvenile delinquents of each sex enumerated on January 1, 1910, and also those committed during the year 1910 are distributed with reference to the kind of penal or reformatory institution in which they were confined or to which they were committed.

A much larger proportion of the male prisoners and juvenile delinquents enumerated on January 1, 1910, than of the female were confined in state prisons, and a much smaller proportion in juvenile reformatories. In fact, 44.5 per cent of the males enumerated were state prison convicts, but only 13.1 per cent of the females. On the other hand, 49.1 per cent, or nearly one-half, of the females enumerated were inmates of juvenile reformatories, while the corresponding proportion for males was 15.3 per cent, or a little less than one-sixth. The proportion in each of the other classes of institutions was not very different for the two sexes, the percentage in municipal jails being somewhat larger and that in county jails somewhat smaller for males than for females.

United States penitentiaries	987	986	1	.....	0.2	(1)

[1] Less than one-tenth of 1 per cent.

As regards the distribution of the prisoners and juvenile delinquents committed during the year, the proportion sent to state prisons is again much larger for males than for females, and the proportion sent to juvenile reformatories much smaller. The great majority of the offenders of either sex, however, were committed to county or municipal jails, 91.4 per cent of the male offenders and 92.3 per cent of the female being sentenced to such institutions. These percentages are nearly identical, but it is noteworthy that the percentage of male offenders committed to county jails (56.2) was somewhat larger than the corresponding percentage of female offenders (51.9), while the percentage committed to municipal jails was somewhat smaller for males than for females (35.2 as compared with 40.4). This indicates that the great disparity between the two sexes as regards the number of commitments is somewhat less marked in cities than in the country, as is shown also by the column in the above table giving the percentage of females in each class of institutions, the percentage being somewhat larger among the prisoners in municipal jails than among those in county jails. The percentage was largest, however, in the reformatories for juveniles and smallest in the state prisons.

The number of males and of females in the total number of inmates and of commitments is given by states for each class of institutions in General Tables 3 and 4 (pp. 311 and 312). The percentage of females in these totals is shown by geographic divisions in Table 61. It may be noted that in the East North Central division the percentage of females among prisoners committed to state prisons is exceptionally high. This shows the effect upon the figures of the large number (224) of females committed to the Indiana Woman's Prison, an institution in which a large proportion of the inmates are not of the class ordinarily committed to state prisons but are women convicted of minor offenses and committed for short terms. In all other divisions the percentage of females is smaller in the state prisons than in either the county or the municipal jails. In fact, in five states—Iowa, Massachusetts, Michigan, Oregon, and Wyoming—no females were reported among the inmates of the state prisons or among the commitments to these institutions.

The general rule that the percentage of females is larger in the municipal jails than in the county jails holds good in nearly every division; the most important exception appears in the Middle Atlantic division, where many of the larger cities have no municipal jails, and are, therefore, represented in this classification by county jails only, the municipal jails representing for the most part only the smaller cities.

OFFENSE.

Table 62, on the following page, presents the detailed classification by offense of the male and female prisoners and juvenile delinquents committed in 1910.

The proportion of females is largest in the group of offenders convicted of sex offenses or offenses against chastity. Naturally, all the prostitutes committed were females. Of the 1,097 prisoners committed for keeping a house of ill fame, 57.2 per cent were females; of those committed for fornication, 38.4 per cent; and of those committed for adultery, 41.4 per cent. Females constituted only 2.4 per cent of the prisoners committed for grave homicide, 5.7 per cent of those committed for lesser homicide, and 6.5 per cent of those committed for assault. They comprised 5.8 per cent of the total committed for larceny and 8 per cent of the total for having stolen property.

About one-fifth (19.8 per cent) of the juveniles committed for offenses peculiar to children were girls. Of the 170,977 prisoners committed for drunkenness, 12,774, or 7.5 per cent, were females; of the 91,928 committed for disorderly conduct, 15,788, or 17.2 per cent; of the vagrants committed, 7.4 per cent.

Rather surprising is the relatively high percentage of females in the number committed for profanity. Of the 1,387 prisoners committed for this offense, 454, or 32.7 per cent, were females. It may be noted in this connection that more than three-fourths of the males and more than nine-tenths of the females who were committed for this offense were residents of the Southern states; and it is probable that many of these offenders were Negroes.

[1] Less than one-tenth of 1 per cent.

[2] Per cent not shown where base is less than 100.

The following is a list of all important offense groups in which more than 10 per cent of the prisoners and juvenile delinquents committed were females, with the percentage of females for each group:

Prostitution	100.0
Keeping house of ill fame	57.2
Adultery	41.4
Fornication	38.4
Profanity	32.7
Delinquency	25.6
Incorrigibility	25.6
Disorderly conduct	17.2
Obscenity	17.0
Nuisance	17.0
Dependency	16.3
Contributing to delinquency	16.1
Illegal sale of drugs	14.6
Violating city ordinances	12.8

Table 63, on the following page, presents for each sex the 10 leading offenses as determined by the number of commitments.

Five offenses—drunkenness, disorderly conduct, vagrancy, larceny, and assault—appear on each list and in the same order except that in the case of male offenders drunkenness heads the list, preceding disorderly conduct, while in the case of female offenders disorderly conduct comes first and drunkenness sec-

ond; 52.6 per cent of the male offenders and 58.8 per cent of the female were committed for these two offenses, or more than one-half of the total number in each case.

Table 63 PRISONERS AND JUVENILE DELINQUENTS COMMITTED IN 1910.

Male.			Female.

All others	62,933	14.1	All others	5,779	11.9

In the case of males, the three offenses ranking next in importance to drunkenness and disorderly conduct as regards number of commitments are vagrancy, larceny, and assault, in the order named; but in the case of females, while vagrancy ranks third, prostitution is fourth, so that larceny and assault rank fifth and sixth, respectively.

The five offenses appearing in the list of ten leading offenses for males but not in that for females are fraud, burglary, trespassing, violating liquor laws, and gambling; the five which appear in the list for females but not in that for males are prostitution, fornication, incorrigibility, keeping a house of ill fame, and violating city ordinances.

Table 64 gives by geographic divisions the number and percentage of females in the total number of prisoners and juvenile delinquents committed for each specified offense. General Tables 47 and 48 (pp. 404 and 405) give a summary classification by offense of the male and female prisoners and juvenile delinquents committed in 1910 in each state; and General Tables 39, 40, and 41 (pp. 360 to 383) give the offense classification in detail, by states, for prisoners only.

[2] Per cent not shown where base is less than 100.

SENTENCE.

As is indicated by Table 65, relating to prisoners committed in 1910, there is no very striking difference between the sexes as regards the distribution according to the general character of sentence. No female offenders, however, were sentenced to death. The majority of the offenders of each sex were committed for nonpayment of fine, the proportion being somewhat larger for females (60.4 per cent) than for males (57.9 per cent).

Of the total number of prisoners committed under sentence of imprisonment without fine ("Imprisonment only"), 9.3 per cent were females; of those sentenced to imprisonment and fine, 8.4 per cent; and of those imprisoned for nonpayment of fine, 10 per cent. The percentage of females was considerably larger among prisoners sentenced to imprisonment for a term of less than one year than it was among those sentenced for terms of one year or longer. Where the sentence was imprisonment only, the percentage of females was 10.3 for the shorter term commitments and 4 for the longer. Of those prisoners committed under sentence of life imprisonment, 2.6 per cent were females.

[1] Less than one-tenth of 1 per cent.

Table 66 gives the number and percentage of prisoners of each sex committed for nonpayment of fine in each geographic division. In each of the two North Central and the three southern divisions the percentage of commitments for nonpayment is larger for females than for males; in each of the other divisions the larger percentage is that for males. The difference is most striking in New England, where 42.6 per cent of the male prisoners committed were imprisoned for nonpayment of fine, as compared with 24.8 per cent of the female prisoners.

[1] Less than one-tenth of 1 per cent.
[2] Per cent not shown where base is less than 100.

Of the total number of male prisoners committed in 1910 under sentence of imprisonment, 11.8 per cent were sentenced for a definite term of one year or longer or for life, 48 per cent for a term of one month or more but less than one year, and 32.3 per cent for a term of less than one month. For female prisoners the corresponding percentages were respectively 4.8, 58.2, and 29.6. Thus the comparison indicates that long sentences—for a year or more—and very short sentences—for less than one month—are relatively more frequent in the commitment of males than of females, but that moderately short sentences—for one to six months—are relatively more frequent in the commitment of females. Of course, the relative length of sentence for the two sexes is probably to a large degree determined by the difference between them as regards the offenses for which they are committed, although it is possible at the same time that the courts may have a tendency to treat one sex more leniently than the other. It should be borne in mind also that there is a material difference in the geographic distribution of the prisoners of one sex as compared with the other. About one-third of the total number of female prisoners committed in 1910 were included in the returns for the Southern states, as compared with about one-fourth of the male prisoners.

Of the prisoners sentenced to a term of one year or longer, 3.9 per cent were females; of those sentenced to a term of less than one year, 9.9 per cent. The percentage of females in the several classes as defined by sentence in the above table reaches its maximum in the class sentenced to imprisonment for six months without fine, 15.5 per cent of the prisoners in this class being females.

In the following table the prisoners sentenced to imprisonment without fine are classified by length of sentence so as to show the number and percentage of females in each class for each geographic division.

[1] Includes figures for United States penitentiaries, which are not shown separately in this table. [2] Includes life sentence. [3] Per cent not shown where base is less than 100.

In every division the percentage of females is larger in the total number of prisoners committed for less than one year than in the total committed for one year or longer, although in some divisions the difference is not very great. In every division outside the South the maximum percentage of females falls in one of the three classes receiving a sentence of one month or over but less than one year, but in each of the three southern divisions the maximum is that for the class sentenced for less than one month.

Table 69 gives by geographic divisions a classification by term of sentence of those prisoners of each sex who were committed under sentence of imprisonment only. It distinguishes three terms of sentence—one year or more, less than one year, and indeterminate.

[1] Includes life sentence. [2] Includes sentence during minority. [3] Less than one-tenth of 1 per cent.

In every division, with one exception, the largest class for either sex, and usually the largest by far, is that sentenced to a definite term of less than one year. The exception noted occurs in the West South Central division, in which a majority of the male prisoners, but not of the female, were sentenced for a term of one year or more.

In every division the percentage sentenced for one year or more was smaller, and except in New England the percentage sentenced for less than one year was greater, in the total number of females committed than in the total number of males. For either sex these percentages varied widely in the different divisions. Thus the percentage sentenced for one year or longer in the case of males ranged from 3.7 in New England to 61.9 in the West South Central division, and in the case of females from 0.6 in the Mountain division to 34.8 in the West South Central.

In every division except New England the percentage receiving an indeterminate sentence was larger for males than for females.

AGE.

The following table gives the number and percentage of females in the total number of prisoners and juvenile delinquents committed in each age group, together with the ratio of commitments for each sex.

Table 70

Age not reported	53,241	48,591	4,650	8.7	.....	.....	.....	.....

[1] Number committed per 100,000 population of the same sex and age.

The percentage of females reaches its maximum at the age of 15, 18.1 per cent of the total number of juvenile offenders committed to reformatories or penal institutions at that age being girls. The percentage as a rule decreases in the successive older years or age periods. There is, however, a notable increase at the age of 20, which is probably caused by misstatements of age. From the age of 20 up to the age of 65 the percentage declines without any interruption, but in the age group 65 or over it shows a slight increase, which again may be the effect of erroneous age returns.

The percentage of females among prisoners and juvenile delinquents is of course affected in some degree by the percentage of females in the total population, which is shown in the last column of Table 70. In almost every age group there is an excess of males, but this excess is greater, and the percentage of females is accordingly smaller, above the age of 25 than in the younger years. This reflects the influence of immigration, most of the immigrants being adults and a majority of them being of the male sex. The percentage of females among prisoners and juvenile delinquents is, however, determined mainly by the difference between the sexes as regards the proportionate number of each sex committed to penal or reformatory institutions, or in other words by the ratio of commitments for each sex, as shown in Table 70. For females as well as males the ratio reaches its maximum in the age period "21 to 24," but the decrease of the ratio in the older periods is more pronounced for females than for males, and accordingly the contrast between the two as shown by the coefficient of difference increases. Thus for the age period "21 to 24" the quotient obtained when the ratio for males is divided by that for females is 6.9, while for the age period "55 to 64" it is 16.1. This means that if the two sexes were numerically equal in each age group of the total population the ratio of males to females in the prison commitments would be approximately 7 to 1 in the age period "21 to 24," and 16 to 1 in the age period "55 to 64."

The ratios for the earlier years of life, or from 10 to 20, are of interest in connection with the subject of juvenile delinquency. As indicated by the coefficient of difference, or quotient obtained by dividing the ratio of commitments for boys by that for girls, the difference between the sexes as regards the relative number committed to reformatories or penal institutions is greater below the age of 13 than in the older years, and is least at the age of 15. In the interval between 12 and 15 years of age the ratio of commitments increases more rapidly for girls than for boys, and consequently the difference between the sexes in this respect becomes less striking, as is indicated by the decrease in the coefficient shown in Table 70. As a large proportion of the offenses for which girls are committed are sex offenses, this change may be indicative of the biological fact that girls reach sexual maturity at about the age of 12 while the corresponding age for boys is about 14.

Table 71 gives by geographic divisions the proportion of females in the total number of prisoners and juvenile delinquents committed in each age group.

[1] Includes figures for United States penitentiaries, which are not shown separately in this table.

[2] Per cent not shown where base is less than 100.

RACE.

In respect to race, four classes of prisoners have been distinguished in the tabulation of the census data, namely (1) white, (2) Negro, (3) Indian, and (4) Chinese, Japanese, and all other. Numerically the third and fourth classes are relatively unimportant, comprising only 0.4 per cent of the total population of the United States; and the Chinese and Japanese were combined in this classification simply because their numbers were regarded as too small to justify separate tabulation. The residuary group "all other" provides for Hindus, Koreans, Filipinos, and Maoris, of whom there were in 1910 only 3,175 in the total population of the United States. It is by no means certain that any of these races were actually represented in the census of prisoners and in any event the number must have been insignificant. In the schedules used in obtaining the data for the census of prisoners a distinction was drawn between "black," defined as covering full-blooded Negroes, and "mulatto," defined as covering all persons not full-blooded Negroes but having some proportion or trace of Negro blood and regarded as Negroes in the community in which they live; but this distinction as made in the returns received was considered to be of such uncertain value and doubtful reliability that it was disregarded in the tabulation of the data. Because of the small numbers involved the data regarding the third and fourth of the classes specified above were not tabulated in as great detail as the data relating to the white and the Negro prisoners.

Table 72

RACE.	Total population: 1910.	PRISONERS AND JUVENILE DELINQUENTS: 1910. Enumerated January 1. Number.	Enumerated January 1. Ratio per 100,000 population of same race.	Committed during the year. Number.	Committed during the year. Ratio per 100,000 population of same race.	PER CENT DISTRIBUTION. Total population: 1910.	Prisoners and juvenile delinquents: 1910. Enumerated January 1.	Prisoners and juvenile delinquents: 1910. Committed during the year.
Total	91,972,266	136,472	148.4	493,934	537.0	100.0	100.0	100.0
White	81,731,957	93,841	114.8	382,052	467.4	88.9	68.8	77.3
Negro	9,827,763	41,729	424.6	108,268	1,101.7	10.7	30.6	21.9

Indian	265,683	(1)	(1)	2,963	1,115.2	0.3	(1)	0.6
Chinese, Japanese, and all other	146,863	(1)	(1)	651	443.3	0.2	(1)	0.1

[1] Separate figures not available.

As shown by Table 72, 30.6 per cent of the total number of prisoners and juvenile delinquents enumerated January 1, 1910, and 21.9 per cent of the number committed during the year 1910 were Negroes, whereas in the total population of the United States the percentage of Negroes was only 10.7. The ratio of Negroes committed per 100,000 Negro population was 1,101.7 and the corresponding ratio for the whites 467.4. Accordingly, the ratio of commitments for Negroes was about two and one-half times that for whites. The ratio of commitments for Indians (1,115.2 per 100,000) was slightly higher than that for Negroes, while the combined ratio (443.3 per 100,000) for the Chinese, Japanese, and other colored races was lower than that for the whites.

GEOGRAPHIC DIVISIONS.

The distribution by race of the prisoners and juvenile delinquents in each geographic division is shown in Table 73.

Table 73

[1] Less than one-tenth of 1 per cent.

The percentage of Negroes among prisoners and juvenile delinquents is relatively large in the southern divisions, and that of persons designated as "Other colored" in the West South Central, Mountain, and Pacific divisions. Of course, these percentages are largely determined by the racial composition of the general population in the several divisions. In every division, however, the percentage of Negroes is much higher among prisoners and juvenile delinquents than in the general population (see Table 74), and in every division also it is higher for the prison population on January 1 than for the commitments during the year—a fact which indicates that the term of imprisonment for Negroes is above the average for all prisoners.

Table 74

SECTION AND DIVISION.	PER CENT NEGRO.		
	In total population: 1910.	Among prisoners and juvenile delinquents: 1910.

United States penitentiaries	.....	31.3	24.6

Table 75 gives, by sections and divisions, the ratio of commitments for the two chief racial classes, or the number committed per 100,000 population of the same class, together with the coefficient of difference, this being the quotient obtained by dividing the ratio of commitments for Negroes by that for whites.

Both for the whites and for the Negroes the ratio of commitments is highest in the Mountain division and lowest in the West South Central. In general, prison and jail commitments are less frequent relatively to the population in the South than in the North for whites as well as for Negroes. It is obvious, however, that the relatively low ratio of commitments in the South, where, as already noted, nine-tenths of the Negroes are located, will have more influence in lowering the ratio for the United States in the case of Negroes than in the case of whites. For this reason figures shown for the United States do not fully reveal the contrast between the two races as regards the frequency of jail and prison commitments, the ratio of commitments for Negroes in the entire United States being about two and one-half times that for the whites, while in every geographic division except New England the difference is more marked. Thus in the West South Central division the ratio for Negroes is three times, in the South Atlantic division more than three times, and in the East South Central division almost four times that for whites. In some of the other divisions the contrast is still more striking; in the West North Central division the ratio for Negroes is almost eight times as great as that for whites and the difference is not much less in the East North Central division.

[1] Number committed per 100,000 population of the same race.
[2] Includes figures for United States penitentiaries, which are not shown separately in this table.

For reasons already stated (see p. 20) the ratio of commitments for all classes of the population is greater in cities than in rural districts; and that may explain to some extent the fact that the contrast between the two races is more pronounced in the North than in the South. For the North is more urban than the South; and in the North the proportion of Negroes living in cities, defined as incorporated places of over 2,500 inhabitants, greatly exceeds the proportion of whites living in such places, 77.4 per cent of the northern Negroes being residents of urban territory in 1910, as compared with 58.3 per cent of the northern whites. In the South, on the other hand, the difference between the two races in this respect is not very great; in fact in the two South Central divisions there is practically no difference between the Negroes and whites as regards the percentage living in cities, while in the South Atlantic division the higher percentage is that for whites. Table 76 gives the percentage of the whites and of the Negroes living in urban communities in each geographic division, and in the North, the South, and the West.

Table 76 — Section and division	Per cent living in urban communities: 1910. White population.	Negro population.
United States	48.7	27.4
The North	58.3	77.4
New England	83.2	91.8
Middle Atlantic	70.8	81.2

Mountain	36.7	72.0
Pacific	57.0	83.4

Table 77 shows, by geographic divisions and sections, the number and ratio of commitments for Indians and for Chinese, Japanese, and all other colored races (except Negroes) combined. In some of the geographic divisions these classes of the population are represented by such small numbers that the ratios can not be accepted as especially significant. It may be noted, however, as regards the ratio for the Indians that it is smaller than that for the Negroes (shown in Table 75) in every division except New England and larger than that for the whites in every division except the South Atlantic.

Table 77 — Section and division	Indian. Total population: 1910.	Prisoners and juvenile delinquents committed in 1910. Number.	Ratio per 100,000 population of same races. Pacific	32,458	488	1,503.5	106,778	370	346.5
United States penitentiaries	.....	24	.....	.....	11	.....

[1] Includes Hindus, Koreans, Filipinos, and Maoris. In the total population of the United States in 1910 there were only 3,175 representatives of these races.

The ratio for the Chinese, Japanese, etc., is smaller than that for the Negroes in all divisions except the three southern, and is considerably smaller than that for the whites in the Pacific and Mountain divisions, where most of the representatives of these Asiatic races are located, and somewhat smaller than that for the whites in the New England and Middle Atlantic divisions.

In the following table the number of white and of Negro prisoners and juvenile delinquents committed, with the ratio of commitments and the coefficient of difference, is given for each of the Southern states and for every other state having a Negro population of 10,000 or over in 1910.

Table 78 — Section, division, and state	Prisoners and juvenile delinquents committed in 1910. Number. White.	Negro.	Ratio of commitments.[1] White. A	Negro. B	Coefficient of difference. B÷A

United States penitentiaries	709	243	.....	.....	.....

[1] Number committed per 100,000 population of the same race.

In the Southern states the coefficient of difference between the ratio for Negroes and that for whites ranged from 2.1 in Florida to 7.8 in Kentucky; in those Northern states for which figures are given the range was from 2.1 for Massachusetts to 11 in Kansas. The coefficient was below 5 in 12 of the 17 Southern states (including the District of Columbia) and in 4 of the 12 Northern states for which figures are given.

CLASS OF INSTITUTION.

In Table 79, on the following page, white and Negro offenders in the United States as a whole and in the North, the South, and the West are distributed according to the class of institution to which they were committed.

[1] Figures for the United States include those for United States penitentiaries, which are not shown separately in this table.
[2] Less than one-tenth of 1 per cent.

Of the white prisoners and juvenile delinquents, 59.5 per cent were committed to county jails, 32.5 per cent to municipal jails, and 3.4 per cent to state prisons; in the case of the Negroes the corresponding percentages were 42.4, 47.3, and 8, respectively. Thus a smaller proportion of the Negro prisoners than of the white were committed to county jails and a larger proportion to municipal jails and state prisons. The difference as regards the proportion of commitments to municipal jails appears to be due to the concentration of Negroes in northern cities, for in the South the percentage committed to municipal jails is slightly smaller, and the percentage committed to county jails slightly larger, for Negro offenders than for white. The relatively large percentage of Negro offenders committed to state prisons reflects the difference between the whites and Negroes as regards the nature of the offenses for which they were sentenced, a difference which is shown in the next section, presenting the offense classification for each race.

In the North the proportion of offenders sent to reformatories for adults or juveniles is about the same for Negroes as for whites. In the South, however, the percentage of Negroes sent to reformatory institutions is relatively small.

OFFENSE.

In Table 80, on the following page, the prisoners and juvenile delinquents committed in 1910 are classified by race—whether white, Negro, or "Other colored"—and by offense for which committed.

Negroes, as already noted, constituted a little more than one-fifth (21.9 per cent) of the total number of prisoners and juvenile delinquents committed in the year 1910 for all offenses. They represented 56 per cent of the total number committed for grave homicide, 49 per cent of the total for lesser homicide, and 41.1 per cent of the total for assault. They contributed 33.6 per cent, or one-third, of the commitments for prostitution and fornication, and almost as large a proportion of the commitments for robbery, burglary, and larceny, and for violating liquor laws. On the other hand, they comprised only about 16 per cent of those committed for drunkenness and disorderly conduct and for vagrancy.

As shown by the last column of Table 80, in proportion to their numbers in the total population, eleven times as many Negroes as whites were committed for grave homicide, eight times as many for lesser homicide, six times as many for assault, and from three to four times as many for prostitution and fornication, robbery, violating liquor laws, larceny, burglary, and rape. For drunkenness and disorderly conduct, vagrancy, fraud, and forgery there were only about one and one-half times as many commitments among Negroes as among whites in proportion to the population. For every offense or offense group distinguished in the above table, however, the ratio of commitments was higher among Negroes than among whites, with the single exception of the group of offenses peculiar to children. This exception is probably indicative in part of the deficiency of reformatories for Negro juvenile delinquents in those sections of the country where the Negroes are most numerous, while a further contributory factor is found in the circumstance that even in states where such reformatories exist the ordinary criminal terminology is still employed to a considerable extent in trying juveniles (see p. 160).

[1] Number committed per 100,000 population of the same race.

While these figures will probably be generally accepted as indicating that there is more criminality and lawbreaking among Negroes than among whites, and while that conclusion is probably justified by the facts, it should be borne in mind that the difference between the two races in this respect may very well be less than the ratios based on the number of commitments to prison or jail would indicate. It is a question whether the difference shown by the ratios may not be to some extent the result of discrimination in the treatment of white and Negro offenders on the part of the community and the courts. An offense committed by a Negro is perhaps more likely to be punished than the same offense committed by a white man, especially if the victim of the offense committed by the Negro is white while in the other case the victim is Negro. It is probable that, as compared with the white man, the Negro when brought to trial on a criminal charge is in fewer instances able to employ expert counsel to defend his case and assist him in taking advantage of any technicalities in the law which may be in his favor. Moreover, in the case of those offenses for which the penalty may be a fine with imprisonment as the alternative if the fine is not paid, it is probable that the Negro is more often unable to pay the fine than the white man, and is therefore more likely to be sent to jail; but of course this consideration has little weight in connection with the more serious offenses which are seldom penalized by fines only. On the other hand, it is not improbable that many of the minor offenses committed by Negroes and not directly affecting white people are more likely to be disregarded by the officers of the law than are the same offenses committed by the whites. Although these are questions on which no statistical data can be presented and in regard to which opinions may differ, it seems proper to call attention to them in this connection as representing possibilities which ought to be considered before accepting the record of prison commitments as an accurate measure of the difference between the two races in respect to criminality. It must always be borne in mind that the amount of crime punished in different classes or communities may not bear a fixed or unvarying ratio to the amount of crime committed.

In Table 81, on the following page, the distribution by offense and race of the prisoners and juvenile delinquents committed in 1910 is shown separately for the North, the South, and the West.

The percentage of Negroes in the total number of commitments for any given offense is naturally much larger in the South than in either the North or the West. Thus the percentage of Negroes in the total number of commitments for grave homicide was 26.1 in the North, 74.4 in the South, and 8.5 in the West. But if the several offense groups are ranked with respect to the percentage of Negroes in the commitments it will be found that the order for the North does not differ radically from that for the South; that is to say, an offense for which the rank as respects the percentage of Negroes is relatively high in the North will show a relatively high rank in the South also. For instance, in the North the five offenses for which the percentage of Negroes was largest were in the order of the size of the percentage (shown in parentheses) as follows: Grave homicide (26.1), prostitution and fornication (24.5), lesser homicide (22.4), robbery (22.3), and assault (19.8). In the South the corresponding list comprised assault (76.2), grave homicide (74.4), larceny (72.5), robbery (71.8), and burglary (68.8). Three of the specified offenses appear in each list. The list for the North, however, includes prosti-

tution and fornication, ranking second, and lesser homicide, ranking third, offenses which in the South ranked, respectively, eighth and sixth, while the list for the South includes larceny, ranking third, and burglary, ranking fifth, offenses which in the North ranked sixth and seventh, respectively.

The five offenses for which the percentage of Negroes was smallest were in the North forgery (5.2), fraud (6.7), drunkenness and disorderly conduct (6.7), malicious mischief and trespassing (7.7), and offenses peculiar to children (9.4); in the South they were offenses peculiar to children (20.8), forgery (38.2), fraud (46.5), drunkenness and disorderly conduct (50.9), and malicious mischief and trespassing (51). The lists are identical, the only difference being one of order caused by the difference in the relative importance of offenses peculiar to children.

In the West the percentage of Negroes was conspicuously high (17.9) in the commitments for prostitution and fornication, the next highest percentages being those for grave homicide (8.5), and for assault (7.6).

All others	3,510	3,152	182	176	89.8	5.2	5.0	5.9	9.8	8.7

[1] Less than one-tenth of 1 per cent.

The ratio of commitments per 100,000 population and the coefficient of difference presented in Table 82 show that for every offense the contrast between the whites and Negroes is greater in the North than in the South. As already suggested, this may be due in part to the fact that in the North the Negroes are concentrated in cities to a much greater degree than the white population, whereas in the South there is not much difference between the two races in this respect (see p. 88).

[1] Number of prisoners and juvenile delinquents committed in 1910 per 100,000 population of the same race.

Regarding the Indians, Chinese, and Japanese, who are grouped under the head of "Other colored" (see Table 81), it may be noted that in the North and South they represent only a small percentage of the total number of commitments for any given offense, the reason for this being, of course, the fact that they constitute only a small percentage of the total population. In the North they were most conspicuous in the commitments for violation of liquor laws, 2.5 per cent of the prisoners and juvenile delinquents committed for this offense being "Other colored"; the next highest percentage was that for rape (1.2). In the South the two highest percentages representing the "Other colored" were those for forgery (1.9) and violating liquor laws (1). Naturally the percentages for the West were much higher. In that section 11.8 per cent of the prisoners and juvenile delinquents committed for violating liquor laws were Indians, Chinese, or Japanese, probably most of them Indians; for lesser homicide the corresponding percentage was 11.2, for grave homicide 9.6, for assault 5.1, and for robbery 5.

In Table 83, which presents ratios of commitments per 100,000 population by geographic divisions, the whites and Negroes committed in 1910 are divided into two broad classes as regards offense, one class comprising those committed for drunkenness and disorderly conduct and the other those committed for all other offenses.

[1] Number of prisoners and juvenile delinquents committed in 1910 per 100,000 population of the same race.

In the United States as a whole, and in every division, the ratio of commitments for each class of offenses is larger for Negroes than for whites, but the difference between the two races in this respect is always less marked in the case of drunkenness and disorderly conduct than it is for other offenses. Thus for the United States as a whole the ratio of commitments per 100,000 population for drunkenness and disorderly conduct among Negroes (424.9) was 1.6 times the corresponding ratio among whites (267.8), but as regards the total for all other offenses the ratio in the case of Negroes (676.7) was 3.4 times that in the case of whites (199.6). A similar relationship is indicated by the figures for each section and geographic division, the coefficient of difference between the races being always less for drunkenness and disorderly conduct than for other offenses. In the South as a whole the coefficients were, respectively, 2.5 and 4.5, which means that in proportion to their numbers Negroes in the South are committed for drunkenness and disorderly conduct two and one-half times as often as white men, but are committed for other offenses four and one-half times as often.

As between the North and the South it is very evident that the ratios are to a large degree determined by local conditions affecting both races alike, because for Negroes as well as whites the ratios for each class of offenses are much lower in the South than in either the North or the West. In the case of drunkenness and disorderly conduct the ratios of commitments for both races are exceptionally low in the West South Central division. In the case of other offenses the ratio for the whites is lowest in the East South Central division,

and that for the Negroes is lowest in the West South Central. As between the different divisions outside the South the variations in the ratios for the two races do not, however, show any very close correspondence. As regards offenses other than drunkenness and disorderly conduct the highest ratio of commitments for each race is that in the Mountain division, but the lowest ratio (outside the South) in the case of whites is that for the West North Central division and in the case of Negroes that for the Middle Atlantic division. For drunkenness and disorderly conduct New England shows the highest ratio for whites and the lowest outside the South for Negroes.

In respect to either class of offenses it will be found that the difference between the whites and the Negroes in the ratio of commitments is greater in the North than in the South. Thus in the North the commitments for drunkenness or disorderly conduct were 3.8 times as frequent for Negroes as for whites; in the South, 2.5 times as frequent. For other offenses the ratio of commitments for Negroes in the North was 8.4 times that for whites; in the South, 4.5 times. In this connection it should be remembered that the Negroes are very unevenly distributed over the Northern states, that they are concentrated largely in a few cities or in districts bordering the Southern states, and that many Northern states with a large white population have only a negligible number of Negroes. Accordingly, in the case of any aggregates such as those presented in Table 83 covering groups of states, the difference in the geographic distribution of the two races must have a considerable effect upon the figures, but an effect which can not be easily measured or determined. For instance, in the West North Central division 65 per cent of the Negroes in 1910 were in the one state of Missouri, as compared with 28 per cent of the whites; and consequently conditions in that state have a much greater influence upon the division totals for Negroes than upon those for whites. Moreover. the marked differences in distribution obtain not only as between states but within the same state. In the state of New York, for instance, 68.3 per cent of the Negroes in 1910 were in the city of New York and only 52 per cent of the whites. It is probable, therefore, that in the Northern states the figures for the two races are affected by local influences which are widely dissimilar

SENTENCE.

In the following table the white, Negro, and "Other colored" prisoners and juvenile delinquents committed in 1910 are classified with respect to the general character of the sentence imposed, and those committed under sentence of imprisonment without fine are further classified by length of sentence:

Table 84

[1] Less than one-tenth of 1 per cent.

Of the 130 offenders sentenced to death, 49, or 37.7 per cent, were Negroes; among those sentenced to imprisonment and fine the proportion of Negroes was 28.3 per cent; and among those imprisoned for nonpayment of fine it was 24.3 per cent. Of the prisoners and juvenile delinquents sentenced to imprisonment without fine, 16.4 per cent were Negroes.

Of those sentenced to imprisonment without fine for a definite term of one year or longer or for life, 40.9 per cent were Negroes; of those sentenced for a term of less than one year, 13.4 per cent. This difference is partly explained by conditions in the South, where for both races the proportion of commitments for long terms is greater than in the North. In other words, it is in part a sectional difference rather than a racial one. Nevertheless, comparisons presented later show that even within the same geographic division or the same state the percentage of Negroes is as a rule greater among the prisoners committed for long terms than among those committed for short terms.

As shown by the table, the percentage of Negroes increases regularly with each extension in the length of the imprisonment sentence, starting with 10.5 for prisoners and juvenile delinquents sentenced for less than one month and reaching 49.3 for those sentenced for five years or over, and 62.6 for those sentenced for life.

The last three columns of Table 84 show the percentage distribution of the white, the Negro, and the "Other colored" prisoners and juvenile delinquents by nature and length of sentence. The death sentence was reported for less than one-tenth of 1 per cent of any class of prisoners, but was relatively more frequent for Negroes committed than for whites. The sentence to imprisonment without fine was imposed upon 37.3 per cent of the white offenders and 25.9 per cent of the Negro. The sentence to imprisonment and fine, on the other hand, was relatively more frequent among the Negro offenders than among the white, 11 per cent of the former as against 7.8 per cent of the latter receiving this form of sentence.

The class imprisoned for nonpayment of fine comprised 62.7 per cent of the total number of Negroes committed, as compared with 54.6 per cent of the total number of whites. This difference might be regarded as indicative of the wider prevalence of poverty among Negroes as compared with whites, but from an inspection of the following table giving figures by geographic divisions it appears to be due mainly to the difference in the geographic distribution of the two races.

Table 85

DIVISION.	PRISONERS AND JUVENILE DELINQUENTS COMMITTED IN 1910.					
	White.			Negro.		
	Total.	Imprisoned for nonpayment of fine.		Total.	Imprisoned for nonpayment of fine.	
		Number.	Per cent of total.		Number.	Per cent of total.
United States	382,052	208,737	54.6	108,268	67,860	62.7
New England	50,511	20,226	40.0	1,347	532	39.5
Middle Atlantic	104,105	47,433	45.6	10,807	5,257	48.6
East North Central	75,550	47,758	63.2	9,414	5,412	57.5
West North Central	44,775	27,125	60.6	7,577	4,359	57.5
South Atlantic	25,620	17,466	68.2	41,226	27,949	67.8
East South Central	13,357	8,496	63.6	23,347	15,659	67.1
West South Central	14,046	9,524	67.8	12,449	7,841	63.0
Mountain	20,621	12,562	60.9	1,008	472	46.8
Pacific	32,758	18,147	55.4	850	379	44.6
United States penitentiaries	709	.....	.....	243	.....	.....

As regards the percentage imprisoned for nonpayment of fine, shown in the above table, it may be noted that the difference between the two races, although rather marked for the United States as a whole, is much less so in most of the divisions, and furthermore that while for the United States as a whole the percentage for Negroes (62.7) was considerably higher than that for whites (54.6), there are only two divisions, the Middle Atlantic and the East South Central, in which that was the case. In two of the other divisions, New England and the South Atlantic, the two percentages were nearly identical, and in the remaining divisions the percentage for whites was somewhat higher than that for Negroes. It is evident, then, that the comparatively high percentage of commitments for nonpayment of fine shown for Negroes in the total for the United States reflects conditions in the South, where such commitments are more common for both races than in other sections of the United States.

The percentage of prisoners imprisoned for nonpayment of fine, it may be noted, is determined by two independent factors, first the percentage of convicted offenders receiving a sentence of fine only, and second, the percentage of those receiving such a sentence who fail or refuse to pay the fine. It is quite probable that within the same state or community a smaller percentage of the Negro offenders than of the white are merely fined, because the figures already presented indicate that a smaller proportion of the Negroes than of the whites are convicted of minor offenses. On the other hand, it is probable that among Negroes who are merely fined the percentage unable to pay is larger than in the same class of white offenders. Thus the one factor would tend to make the percentage imprisoned for nonpayment of fine smaller in the total number of Negro prisoners committed than in the total number of white, while the other factor would have the opposite tendency; and it may very well be that the fact that in most geographic divisions the percentages for the two races are not far apart indicates that these opposing tendencies nearly equalize or offset each other.

In the next table the white, Negro, and "Other colored" prisoners and juvenile delinquents sentenced to imprisonment only are classified with respect to the term of sentence.

Table 86

LENGTH OF SENTENCE.	PRISONERS AND JUVENILE DELINQUENTS COMMITTED IN 1910 UNDER SENTENCE OF IMPRISONMENT ONLY.					
	Number.			Per cent distribution.		
	White.	Negro.	Other colored.	White.	Negro.	Other colored.

Indeterminate	15,975	1,663	43	11.2	5.9	4.9
Length of sentence not reported	639	210	4	0.4	0.7	0.5

Of the white prisoners and juvenile delinquents committed in 1910 under sentence of imprisonment without fine, 74.3 per cent, or nearly three-fourths, were sentenced for a definite term of less than one year; in the case of the Negroes the proportion was much smaller, the percentage being 58.8. On the other hand, the percentage committed for a definite

term of one year or over was 28.3 for Negroes, as against 8.2 for whites. Some of the reasons for this difference between the two races as regards length of sentence are suggested in connection with Table 88, on this page, showing the figures in somewhat greater detail.

The indeterminate sentence was imposed on a considerably larger proportion of the white than of the Negro prisoners and juvenile delinquents (11.2 per cent as compared with 5.9 per cent), partly because it is a form of sentence more common in the North than in the South. In the South it was more usual for white prisoners than for Negro. Outside the South, on the other hand, a larger proportion of the Negro prisoners than of the white received this form of sentence in every division except New England.

Table 87 — PRISONERS AND JUVENILE DELINQUENTS COMMITTED IN 1910 UNDER SENTENCE OF IMPRISONMENT ONLY.

[1] Includes figures for United States penitentiaries, which are not shown separately in this table.

Table 88, presenting a classification by length of sentence, is restricted to prisoners committed for life or for a definite term of imprisonment without fine. It does not, therefore, include those sentenced to death or for their minority or for an indeterminate period, those sentenced to imprisonment and fine, or those imprisoned for nonpayment of fine.

The table brings out the very marked contrast between the two races as regards the length of sentence. Of the Negroes sentenced to imprisonment for life or for a definite term without the added penalty of a fine, 33.8 per cent, or practically one-third, received a sentence of one year or more, while the corresponding percentage for whites was only 10.2. On the other hand, only 21.4 per cent of the Negroes, as against 38.5 per cent of the whites, received a sentence of less than one month, and 35.5 per cent of the former, as against 58.9 per cent of the latter, received a sentence of less than two months.

That there may be some discrimination between whites and Negroes as regards the penalty imposed for the same offense is not improbable, but it is reasonably certain that this is not the principal explanation of the difference in the length of sentence shown for the two races. Two other factors influence the figures. One is the difference in the practice of the courts and in the laws of different states as regards the penalties prescribed or imposed for crimes and misdemeanors. In this respect conditions in the South, where a relatively large proportion of the prison commitments are for long terms, of course have more influence upon the figures for Negroes than upon those for whites. The other factor referred to is the difference in the relative number of minor offenses committed by each race. As shown by figures previously presented, 68.3 per cent of the white offenders were committed for drunkenness, disorderly conduct, or vagrancy, while for Negroes the corresponding percentage was but 46.2. A difference such as this would naturally have a marked effect upon the relative length of sentence for the two classes.

Table 88 — PRISONERS AND JUVENILE DELINQUENTS COMMITTED IN 1910 FOR LIFE OR FOR A DEFINITE TERM OF IMPRISONMENT WITHOUT FINE.

LENGTH OF SENTENCE.	White.	Negro.		Other colored.	Per cent distribution.		
		Number.	Per cent of total.		White.	Negro.	Other colored.
Total	117,851	24,948	17.4	821	100.0	100.0	100.0
1 year or over	12,000	8,440	40.9	176	10.2	33.8	21.4
Life	281	490	62.6	12	0.2	2.0	1.5
10 years or over	734	913	54.8	18	0.6	3.7	2.2
5 to 9 years	1,465	1,260	46.0	16	1.2	5.1	1.9
2 to 4 years	4,377	3,001	40.4	56	3.7	12.0	6.8
1 year	5,143	2,776	34.7	74	4.4	11.1	9.0
Less than 1 year	105,851	16,508	13.4	645	89.8	66.2	78.6
7 months or over	1,094	640	36.8	6	0.9	2.6	0.7
6 months	9,232	2,165	18.9	38	7.8	8.7	4.6
4 or 5 months	2,919	863	22.7	16	2.5	3.5	1.9
3 months	13,871	2,282	14.1	72	11.8	9.1	8.8
2 months	9,318	1,703	15.4	69	7.9	6.8	8.4
1 month	24,009	3,517	12.7	158	20.4	14.1	19.2
Less than 1 month	45,408	5,338	10.5	286	38.5	21.4	34.8

Table 89, which gives by geographic divisions the distribution by length of sentence of the white and Negro prisoners and juvenile delinquents sentenced to imprisonment for life or a definite term without fine, shows that in every geographic division except one, the Mountain division, a larger percentage of the Negro offenders of this class than of the white were committed for a term of one year or longer. The difference is quite as pronounced in the northern divisions as in the southern, but it is again evident that the difference in the United States as a whole is partly a result of the difference in the geographic distribution of the two races. If the distribution of the Negro prisoners and juvenile delinquents by geographic divisions had been the same as that of the white without any change in the percentage of Negroes sentenced to a term of one year or more in each division, the percentage for the entire United States would have been 17 instead of 33.8, the actual percentage. The comparison indicates the extent to which the difference between the Negroes and whitse

in this respect is due to the difference in geographic distribution.

In most divisions the percentage sentenced for less than one year but not less than one month is larger for the Negroes than for the whites. The difference between the races, however, is most striking as regards the percentage sentenced for less than one month, this percentage being invariably much smaller for the Negroes than for the whites.

[1] Includes life sentence.

Table 90 shows the approximate average length of sentence in months for white and Negro prisoners and juvenile delinquents sentenced to definite terms of imprisonment in each geographic division.

In the United States as a whole the average length of sentence for Negroes is more than three times that for whites, but in none of the geographic divisions except the East North Central is the relative difference as great as this, although in every division except the Mountain division the sentence for Negro offenders is considerably longer than that for white.

Table 90

Table 91, on page 98, shows by states what percentage of the Negro and of the white offenders sentenced to death or to imprisonment for life or a definite term without fine received a sentence of one year or longer; and also what percentage of the total number of prisoners and juvenile delinquents sentenced for one year or longer (including those sentenced to death or imprisonment for life) and for less than one year, respectively, were Negroes. For instance, it shows that in Massachusetts Negroes constituted 5 per cent of the prisoners and juvenile delinquents sentenced for one year or longer and 2.3 per cent of those sentenced for less than one year; and that 4.4 per cent of the white prisoners or juvenile delinquents sentenced for life or for a definite term or to death were sentenced for one year or longer, while the corresponding percentage for Negroes was 9.2.

In this and most of the other states the percentage sentenced for one year or longer is larger for Negroes than for whites and the percentage of Negroes is larger in the total number of prisoners and juvenile delinquents sentenced for one year or longer than in the total number of those sentenced for less than one year.[1] In fact this statement holds true for all but 4 of the 24 states for which all the percentages are shown, the exceptions being Missouri, Nebraska, North Carolina, and Tennessee. It may be noted, however, that in Alabama and Mississippi there was very little difference between whites and Negroes as regards the percentage sentenced for one year or more, and that the percentage of Negroes was accordingly not much larger among offenders sentenced for long terms than among those sentenced for short terms.

[1] The one fact necessarily involves the other in any state in which the prisoners and juvenile delinquents committed were all either whites or Negroes; and although there were few states in which that was actually the case it was nearly so in most states, the number of Chinese, Japanese, and Indians being usually so small as to be almost negligible.

[1] Includes those sentenced to death or to imprisonment for life.

[2] Per cent not shown where base is less than 100.

AGE.

Table 92 shows the distribution according to race of the prisoners and juvenile delinquents in each age group committed in 1910.

As shown by this table, Negroes constituted about one-third of all prisoners and juvenile delinquents committed who were between the ages of 15 and 25, about one-fourth (24.1 per cent) of those between 25 and 35, hardly more than one-eighth (13.8 per cent) of those between 35 and 45, and less than one-twelfth of those 45 or over. This decrease in the percentage in the older age groups is consistent with the fact that the percentage of Negroes, as shown by figures already presented, is much below the average in the commitments for drunkenness and disorderly conduct and for vagrancy, taken in connection with the further fact that these are offenses which account for a large proportion of the total number of commitments in the older age groups (see p. 73).

Table 92 — PRISONERS AND JUVENILE DELINQUENTS COMMITTED IN 1910.

AGE.	Number.				Per cent of total.			Per cent Negro in total population: 1910.

18 to 20 years	35,697	23,080	12,375	242	64.7	34.7	0.7	11.5
21 to 24 years	64,221	42,885	20,834	502	66.8	32.4	0.8	11.3
25 to 34 years	129,974	97,424	31,380	1,170	75.0	24.1	0.9	10.2
35 to 44 years	99,023	84,630	13,685	708	85.5	13.8	0.7	9.3
45 to 54 years	56,230	51,457	4,411	362	91.5	7.8	0.6	8.5
55 to 64 years	22,408	20,949	1,310	149	93.5	5.8	0.7	7.8
65 years or over	7,718	7,152	506	60	92.7	6.6	0.8	7.4
Age not reported	53,241	36,503	16,374	364	68.6	30.8	0.7	18.4

Of the prisoners committed when under the age of 15, about one-fifth were Negroes. The proportion is thus considerably smaller than it is in the age groups from 15 to 34, a circumstance which may be due in part to the fact that a larger proportion of the Negroes than of the whites live in states or communities where there are no juvenile reformatories and the further fact that some states providing reformatories for white juveniles make no such provision for Negro. The establishment of these institutions doubtless has a tendency to increase the number of commitments of juvenile offenders, since they receive for purposes of reformation children who are guilty of juvenile offenses or misconduct not serious enough to justify commitment to a prison or jail. Therefore, where such institutions are lacking, youthful offenders guilty of those juvenile offenses are likely to be allowed to remain at large in the community. But there is still another important factor to be considered in this connection, namely, that one of the offenses for which large numbers of juveniles are committed—truancy—does not come into existence in any community until laws for compulsory school attendance are adopted and enforced. In short, it is an offense which is created by the enactment of such laws; and a larger proportion of the Negroes than of the whites live in sections where there are no such laws, and where there is, therefore, no such offense.

The number and ratio of commitments by age groups for whites and Negroes are shown in the following table:

Table 93 — PRISONERS AND JUVENILE DELINQUENTS COMMITTED IN 1910.

65 years or over	7,152	506	196.5	172.0	0.9
Age not reported	36,503	16,374	.....	.....	.....

[1] Number committed per 100,000 population of the same race and age.

As indicated by the coefficient in the above table, the difference between the whites and the Negroes with respect to the ratio of commitments is relatively small in the period of childhood, but shows a tendency to increase in each older year of life up to the age of 16. In the age groups covering the period from 16 to 24 years the ratio of commitments for Negroes is about four times as great as that for whites. In the next older age group, "25 to 34 years," however, the ratio for Negroes is less than three times that for whites and in the next age group, "35 to 44 years," is only about one and one-half times as great, while after the age of 44 it is below that for whites.

In the case of the Negroes the ratio of commitments reaches its maximum in the age group "21 to 24 years," while in the case of the whites the maximum falls in the age group "35 to 44 years."

Table 94, on the following page, shows separately for the whites and the Negroes the number and ratio of commitments, by age groups, in the United States as a whole and in the North and the South. Although totals are given for the West also, the figures are not given by age because of the small number of Negroes in that section.

The table shows that in every age group, both in the North and in the South, the ratio of commitments is higher for Negroes than for whites, the contrast between the two races in this respect being, however, greater in the North than in the South.

[1] Number committed per 100,000 population of the same race and age.

In both the North and the South the contrast between the whites and the Negroes as regards the ratio of commitments is most pronounced between the ages of 15 and 25 and becomes less marked in each older group up to the age of 65. This results from the fact that the ratio for Negroes declines rapidly after the age of 25, while that for whites in the South declines more slowly and in the North increases up to the age of 45.

Both in the North and in the South the ratio for Negroes reaches its maximum in the age group "21 to 24 years." The ratio for whites in the South also reaches its maximum in this age group, but is almost as high in the next two older groups, "25 to 34 years" and "35 to 44 years"; in the North, as already noted, it increases up to the age of 45, the maximum falling in the group "35 to 44 years."

Although for the United States as a whole the ratio of commitments in each age group above 45 is smaller for Negroes than for whites, this is not the case in either the North or the South. This is another instance of the effect which the difference in the geographic distribution of the two races has upon the totals for the United States. Since 89 per cent of the Negroes live in the South, as compared with 25 per cent of the whites, the influence which the low ratios generally prevailing in the South have upon the United States totals is greater for Negroes than for whites, and this explains why the ratio of commitments above the age of 45 is lower for Negroes than for whites in the United States as a whole, although it is not so in either the North or the South.

The coefficient of difference between the North and South as regards the ratio of commitments per 100,000 of whites and Negroes, respectively, is shown by age groups in Table 95. For whites of all ages the coefficient was 1.9 and for Negroes of all ages 3.2, which means that the ratio of commitments for whites is about twice as great, and for Negroes about three times as great, in the North as it is in the South.

[1] Number of prisoners and juvenile delinquents committed in 1910 per 100,000 population of the same race and age.

This table brings out more clearly the fact, shown also by the preceding table, that the excess of the ratio of commitments for the North over that for the South is in every age group greater in the case of the Negroes than in that of the whites. This is probably because the Negroes in the North, as already stated, are concentrated in cities to a much greater extent than the whites, while there is little difference in the distribution of the two races in the South. In the case of both whites and Negroes the difference between the two sections is greatest in the age groups under 15 and over 45. The coefficient of difference for the Negroes is fairly uniform between the ages of 18 and 45; while that for the whites is uniform between the ages of 15 and 25, after which it increases regularly up to the age group "55 to 64 years," remaining practically stationary in the final group.

SEX.

The following table shows the number of white and of Negro prisoners and juvenile delinquents of each sex enumerated on January 1, 1910, and also the number committed during the year:

Table 96 — PRISONERS AND JUVENILE DELINQUENTS: 1910.	Enumerated January 1.				Committed during the year.			
SEX.	Total.	White.	Negro.	Other colored.	Total.	White.	Negro.	Other colored.
	NUMBER.							
Both sexes	136,472	93,841	41,729	902	493,934	382,052	108,268	3,614
Male	124,424	85,218	38,346	860	445,368	354,367	87,598	3,403
Female	12,048	8,623	3,383	42	48,566	27,685	20,670	211
	PER CENT DISTRIBUTION BY SEX.							
Both sexes	100.0	100.0	100.0	100.0	100.0	100.0	100.0	100.0
Male	91.2	90.8	91.9	95.3	90.2	92.8	80.9	94.2
Female	8.8	9.2	8.1	4.7	9.8	7.2	19.1	5.8
	PER CENT DISTRIBUTION BY RACE.							
Both sexes	100.0	68.8	30.6	0.7	100.0	77.3	21.9	0.7
Male	100.0	68.5	30.8	0.7	100.0	79.6	19.7	0.8
Female	100.0	71.6	28.1	0.3	100.0	57.0	42.6	0.4

In the case of Negroes 19.1 per cent, and in the case of whites 7.2 per cent, of the prisoners and juvenile delinquents committed in the year 1910 were females. Among Negroes, therefore, the ratio of male to female offenders was approximately 4 to 1, the corresponding ratio for whites being 13 to 1. In this respect the sex contrast is, accordingly, much greater for the whites than for the Negroes. It follows as a corollary that the proportion of Negroes is greater among females committed than among males; in fact 42.6 per cent of the total number of female prisoners and juvenile delinquents committed in 1910 were Negroes, as compared with 19.7 per cent of the total number of male offenders.

In the prison and jail population (prisoners and juvenile delinquents enumerated on January 1) as compared with the commitments the contrasts are not as great as regards either the percentage of females in the totals for each race or the percentage of Negroes in the totals for each sex. Moreover, the percentage of females was larger for whites (9.2) than for Negroes (8.1) and the percentage of Negroes was larger among males (30.8) than among females (28.1). These differences between the prison population and the prison commitments as regards race and sex distribution are probably the outcome of variations in the average term of imprisonment, the figures indicating that the average is greater for Negro males than for white, and at the same time greater for white females than for Negro. The differences in this average are in turn presumably determined largely by differences in the nature and gravity of the offenses for which the different sexes and race classes were committed, the figures indicating the probability that in the case of males the proportion of major offenders was greater among Negroes than among whites and that in the case of the females the difference was the other way. It may be noted, however, that while the classification by offense bears out this inference as regards males, it does not make the situation altogether certain as regards females. Other factors may influence the duration of imprisonment, as, for instance, the relative number committed to reformatories, which is considerably larger for white females than for Negro.

The following table shows the ratio of commitments per 100,000 population for males and females of the white and the Negro race separately:

Table 97 — PRISONERS AND JUVENILE DELINQUENTS COMMITTED IN 1910.	Number.		Ratio of commitments.[1]		
SEX.	White.	Negro.	White. A	Negro. B	Coefficient of difference. B÷A
Both sexes	382,052	108,268	467.4	1,101.7	2.4
Male	354,367	87,598	840.2	1,792.9	2.1
Female	27,685	20,670	70.0	418.3	6.0

[1] Number committed per 100,000 population of the same race and sex.

The contrast between the races as regards the ratio of commitments per 100,000 population was much greater for the female sex than for the male, the ratio for females of the Negro race (418.3 per 100,000) being almost six times the corresponding ratio (70 per 100,000) for females of the white race, while in the case of males the one ratio was hardly more than twice as great as the other (1,792.9 per 100,000 for Negro males, as against 840.2 for white males).

As shown by Table 98 (p. 102), in every division the percentage of Negroes was much larger among the female offenders committed than among the male. In the North 21.9 per cent, or more than one-fifth, of the female offenders were Negroes, as compared with 8.3 per cent of the male offenders; in the South the percentage Negro was 82.1 among female offenders and 55.5 among male offenders.

For every geographic division also, as well as for the United States as a whole, the difference between the races as regards the ratio of commitments to penal or reformatory institutions was much greater for the female than for the male sex, a fact indicated by the coefficient of difference given in the last column of the table. Thus in the North the coefficient was 4.9 for males and 14.7 for females, which means that while Negro males in proportion to their numbers are committed about five times as often as white males, Negro females are committed about fifteen times as often as white females. In the South these coefficients were, respectively, 3.1 and 10.5. In some of the geographic divisions the contrast is still more striking.

SEX AND OFFENSE.

In Table 99 the prisoners and juvenile delinquents committed in 1910 are classified by sex, race, and offense. The table shows the per cent distribution by race for each offense and sex, the per cent distribution by offense for each race and sex, and the ratio of commitments for each offense for whites and Negroes of each sex, with the coefficient of difference.

Among the male offenders as classified by offense the percentage of Negroes reaches its maximum in the group convicted of grave homicide, 526, or 55.7 per cent, of the 944 males committed for this offense being of the Negro race. The next highest percentage of Negroes was that for lesser homicide (47.6), followed by that for assault (38.4). Relatively low percentages are shown for drunkenness and disorderly conduct (13.1), vagrancy (14.3), and forgery (14.2). The lowest percentage is that for offenses peculiar to children (9.7), a circumstance the explanation of which has already been suggested (see p. 90).

Of the 110 females committed for lesser homicide, 80, or 72.7 per cent, were Negroes, and the proportion was about the same in the case of grave homicide, although the percentage is not given in the above table. The percentage of Negroes was still higher among females committed for assault, being 80.3. For larceny it was 58.5. For prostitution and fornication the percentage of Negroes among female offenders was 37.8, which is the lowest percentage shown for females in Table 99, with the exception of that for the group of offenses peculiar to children.

[1] Number committed per 100,000 population of the same race and sex.
[2] It may be noted that the coefficient is not always the figure obtained by dividing the ratio for Negroes by that for whites as given in the table. This is because in computing the coefficient the ratios when small were carried out for three or more decimal places in order to obtain more exact results.
[3] Per cent not shown where base is less than 100.
[4] Less than one-tenth of 1 per cent.
[5] Less than one-tenth of 1 per 100,000.

For every class of offenses distinguished in the above table, except that of offenses peculiar to children, the ratio of commitments is higher for Negroes than for whites of the same sex, the difference being always greater for females than for males. For some offenses, however, the number of females committed is so small that one may hesitate to attach much significance to the exact difference in the relative numbers committed as indicated by the ratios. But it is probably significant that in proportion to their numbers 11 times as many Negro women as white were committed for larceny and about 33 times as many for assault. In the case of prostitution and fornication and of drunkenness and disorderly conduct the difference is not as great, the commitments for these offenses being about five times as frequent relatively to the population among Negro females as among white.

For males alone the difference between whites and Negroes as indicated by the coefficient in the above table does not vary greatly from that for both sexes combined as shown in Table 80.

In Table 100, on the following page, the ratios of commitments per 100,000 population in the North, South, and West for five selected offenses are shown for white and Negro males and females, respectively, together with the coefficient of difference between whites and Negroes of the same sex.

Table 100

OFFENSE AND SECTION.	RATIO OF COMMITMENTS.[1] Males. White.	Males. Negro.	Males. Coefficient of difference.[2]	Females. White.	Females. Negro.	Females. Coefficient of difference.[2]

Vagrancy:						
United States	94.4	136.1	1.4	5.4	32.5	6.0
The North	93.6	492.9	5.3	4.7	81.3	17.4
The South	31.4	86.1	2.7	2.8	24.0	8.5
The West	281.9	1,299.1	4.6	20.7	575.2	27.8
All others:						
United States	167.9	603.1	3.6	10.3	75.0	7.3
The North	165.9	1,218.8	7.3	11.8	212.1	18.0
The South	137.6	520.6	3.8	6.4	58.5	9.1
The West	253.0	1,327.9	5.2	10.5	200.4	19.1

[1] Number of prisoners and juvenile delinquents committed in 1910 per 100,000 population of the same race and sex.
[2] It may be noted that the coefficient is not always the figure obtained by dividing the ratio for Negroes by that for whites as given in the table. This is because in computing the coefficient the ratios when small were carried out for three or more decimal places in order to obtain more exact results.

The relatively high ratio for Negroes as compared with whites of the same sex shown for practically all the offenses in Table 99 covering the entire United States appears also in Table 100 in each section of the country in the case of each of the five offenses shown separately in this table. The difference is likewise always greater for females than for males.

It will be noted that for both males and females the coefficient of difference between the ratios for whites and Negroes is, with one exception, smaller for the United States as a whole than for any of the sections. This is because the low ratio for the South, on account of the large proportion of Negroes there, has a much greater influence on the ratio for the United States in the case of Negroes than in that of whites.

SEX AND AGE.

The following table gives the number, percentage, and ratio of commitments per 100,000 population for whites and Negroes, by sex and age:

Table 101

Female	4,650	1,573	3,043	34	33.8	65.4	0.7	.....	.....	.....

[1] Number committed per 100,000 population of the same race, sex, and age. [2] Based on ratios carried out to the third decimal place.
[3] Per cent not shown where base is less than 100.

In every age group except the youngest, "under 10 years," and the oldest, "65 years or over," a larger percentage of the female offenders committed than of the male were of the Negro race. The difference becomes most marked in the groups between 18 and 25 years of age. Of the male offenders 18 to 20 years of age, 29.9 per cent were Negro, and of the female offenders in the same age group, 68.3 per cent (more than two-thirds). In the age group "21 to 24 years" the percentage Negro was 28.5 for males and 61 for females. In the next older group, "25 to 34 years," it was 21.8 for males and 44.2 for females.

For the Negroes of each sex the ratio of commitments reaches its maximum in the age group "21 to 24 years," while for whites of each sex the maximum falls in the age group "35 to 44 years."

In practically every age group the difference between the races as regards the ratio of commitments is more pronounced for females than for males; but the contrast is greatest in the ages from 18 to 24, inclusive, when the ratio for Negro males is between 3 and 4 times as great as that for white males, while the ratio for Negro females is from 11 to 16 times that for white females.

Above the age of 45 the ratio of commitments for Negro males is lower than that for white males; but the ratio for Negro females is higher than that for white females in every age group except the very oldest, "65 years or over."

In Table 102 the number and ratio of commitments for whites and Negroes, by sex and age, are shown for the North and the South; figures for the West without distinction of age are included.

In every age group the ratio of commitments for either sex of either race is considerably higher in the North than it is for the same sex and race in the South.

Both in the North and the South the ratio of commitments for the Negroes of either sex reaches its maximum in the age group "21 to 24 years" and diminishes steadily with each older age group. This statement is substantially true also of the ratio for the whites in the South; but in the North the ratio for the whites reaches the maximum for each sex in the age group "35 to 44 years."

In every age group both in the North and in the South the ratio of commitments is higher for the Negroes of either sex than for the whites of the same sex, and the racial difference in this respect, as indicated by the coefficient in the above table, is in practically every case greater for the female sex than for the male. Generally, moreover, the racial difference is greater in the North than in the South, exceptions occurring only in the case of females within the age groups "45 to 54" and "55 to 64."

The totals for the entire United States presented in Table 101 showed that above the age of 45 the ratio of commitments was smaller for Negro males than for white males; but Table 102 shows that this is not the case in either the North or the South considered separately.

[1] Number committed per 100,000 population of the same race, sex, and age.

NATIVITY.

The classification with respect to nativity was confined to prisoners and juvenile delinquents who were of the white race, because in the case of the other races the distinction based on country of birth has little significance, since the Negroes and Indians are practically all natives of the United States, and the Chinese and Japanese of adult age are practically all natives of China and Japan. It was not considered worth while, therefore, to tabulate these races by nativity in order merely to segregate the small number of Chinese and Japanese who might be natives of the United States and the small number of Indians and Negroes who might be foreign born.

Table 103

NATIVITY.	WHITE PRISONERS AND JUVENILE DELINQUENTS: 1910.				Per cent distribution of total white population: 1910.
	Enumerated January 1.		Committed during the year.		
	Number.	Per cent distribution.	Number.	Per cent distribution.	
Total	93,841	100.0	382,052	100.0	100.0
Native	71,841	76.6	253,929	66.5	83.7
Foreign born	20,970	22.3	99,639	26.1	16.3
Nativity not reported	1,030	1.1	28,484	7.5	(1)

[1] In the general population report persons whose nativity was not reported were tabulated as natives of the United States.

More than one-fifth (22.3 per cent) of the white prisoners and juvenile delinquents enumerated January 1, 1910, and more than one-fourth (26.1 per cent) of those committed during the year 1910 were reported as foreign born. Of the total white population of the United States 16.3 per cent, or about one-sixth, were foreign born. The percentage foreign born is thus considerably larger among white prisoners than in the total white population. Moreover, as regards the commitments it may be noted that the actual percentage foreign born must be somewhat higher than the percentage reported as foreign born because of the rather large number of cases in which the nativity of the prisoner was not reported. It may safely be assumed, of course, that a considerable proportion of those whose birthplace was not reported were foreign born, and that the percentage reported as foreign born is therefore to that extent deficient.

The fact that the percentage reported as foreign born is higher in the total number of commitments than in the total prison and jail population on January 1 indicates that the foreign-born white as compared with the native white are committed for shorter terms on the average, probably because a larger proportion of them are guilty of minor offenses. More direct evidence on this question is, however, available in the classifications by offense and by length of sentence which are presented later (see pp. 111 and 114).

The following table, showing the total population, the number of prisoners and juvenile delinquents, and the ratio of commitments for each nativity class among the whites, includes for purposes of comparison the figures for nonwhite races:

Table 104

RACE AND NATIVITY.	Total population: 1910.	PRISONERS AND JUVENILE DELINQUENTS: 1910.				PER CENT DISTRIBUTION.		
		Enumerated January 1.		Committed during the year.			Prisoners and juvenile delinquents: 1910.	
		Number.	Ratio per 100,000 population of same race and nativity.	Number.	Ratio per 100,000 population of same race and nativity.	Total population: 1910.	Enumerated January 1.	Committed during the year.
Total	91,972,266	136,472	148.4	493,934	537.0	100.0	100.0	100.0
White	81,731,957	93,841	114.8	382,052	467.4	88.9	68.8	77.3
Native	68,386,412	71,841	105.1	253,929	371.3	74.4	52.6	51.4
Foreign born	13,345,545	20,970	157.1	99,639	746.6	14.5	15.4	20.2
Nativity not reported	(1)	1,030	.....	28,484	.....	(1)	0.8	5.8
Negro	9,827,763	41,729	424.6	108,268	1,101.7	10.7	30.6	21.9
Other colored	412,546	902	218.6	3,614	876.0	0.4	0.7	0.7

[1] In the general population report persons whose nativity was not reported were tabulated as natives of the United States.

The number of native white prisoners and juvenile delinquents committed per 100,000 native white population was 371.3, while the corresponding ratio for the foreign-born white was 746.6, or about twice as large. The ratio for the native white offenders was about one-third, and that for the foreign-born white about two-thirds, as great as that for the Negro (1,101.7 per 100,000), but it may be noted that the ratios for the native and foreign-born white are somewhat below the true figures because of the considerable number of white prisoners whose nativity was not reported. The ratio of commitments for the "Other colored" (including the Indians, Chinese, and Japanese) is intermediate between that for the foreign-born whites and the Negroes.

GEOGRAPHIC DIVISIONS.

The geographic distribution of the foreign-born white population of the United States differs materially from that of the native white, the New England and Middle Atlantic states including 49.8 per cent, or nearly one-half, of the foreign-born white population in 1910, but only 27.4 per cent, or a little more than one-fourth, of the native white. The Southern states, on the other

hand, included only 5.4 per cent of the total foreign-born white population, as compared with 29 per cent of the native white. In view of the differences in the general conditions which determine the relative frequency of prison commitments in the several divisions, this difference in the distribution of the two classes must of course affect in some degree the significance of any comparisons which are based upon totals covering the entire United States, thus making it especially important to compare the figures for geographic divisions, as presented in the following table:

Table 105 — WHITE PRISONERS AND JUVENILE DELINQUENTS: 1910.

Attention has been called to the fact that for a considerable proportion of the commitments the nativity of the prisoners was not reported. This proportion, as shown in Table 105, varied widely in different divisions, being only 0.7 per cent of the total number of commitments in New England, as compared with 27.4 per cent in the West South Central division and 21.9 per cent in the Pacific division. Where the percentage not reported is as large as in the two divisions last named, it is evident that the percentages reported as native and foreign born, respectively, must one or both of them be considerably below the true percentages. In the Pacific division, for instance, the number reported as born in foreign countries, while forming 22.2 per cent of the total number of white prisoners and juvenile delinquents committed, formed 28.4 per cent of the total number committed whose nativity was reported; and the latter will of course represent the true percentage if it can be assumed that the percentage foreign born among those whose nativity was not reported was the same as it was among those whose nativity was reported. While there is some reason to believe that the percentage foreign born was in fact larger among the former—the "not reported" class—than among the latter, it is probable, nevertheless, that percentages based on the total number whose nativity was reported are a fairly close approximation to the actual percentages. Accordingly, the next table gives for each geographic division the percentage foreign born in the total number of white prisoners and juvenile delinquents committed whose nativity was reported, and includes for purposes of comparison the percentage reported as foreign born in the total number of prisoners and juvenile delinquents enumerated and committed and in the total white population.

Table 106

DIVISION.	WHITE PRISONERS AND JUVENILE DELINQUENTS COMMITTED IN 1910, EXCLUSIVE OF THOSE WHOSE NATIVITY WAS NOT REPORTED.				PER CENT REPORTED AS FOREIGN BORN.

United States penitentiaries	709	556	153	21.6	21.6	19.0	.....

The percentage foreign born among prisoners is of course determined largely by the percentage foreign born in the total population. This is the obvious reason why the former percentage is relatively high in New England, for instance, and relatively low in the southern divisions. But the correspondence in this respect between the prison commitments and the general population is not very close. For example, although the percentage foreign born in the white population is very much lower in the Mountain division than in the Middle Atlantic, there is practically no difference between these divisions as regards the percentage foreign born in the total number of white prisoners and juvenile delinquents committed whose nativity was reported. Evidently, then, the compo-

sition of the general population is not the sole factor which determines the variations in the composition of the prison population in different divisions.

In every geographic division, however, the percentage foreign born is considerably higher among the white prisoners and juvenile delinquents than in the total white population, indicating that in proportion to their numbers the immigrants as represented by the foreign-born white population are responsible for a larger number of prison and jail commitments than the native white population. The difference may, however, be measured more directly by comparing the ratio of commitments per 100,000 population for each class, as shown in the following table:

Table 107

DIVISION.	WHITE POPULATION: 1910.		WHITE PRISONERS AND JUVENILE DELINQUENTS COMMITTED IN 1910.

Pacific	3,162,425	861,448	18,304	7,276	578.8	844.6	1.5

[1] Number committed per 100,000 population of the same race and nativity.
[2] Includes figures for United States penitentiaries, which are not shown separately in this table.

In every division the ratio of commitments for the foreign-born white materially exceeds that for the native white; but the contrast is more marked in some divisions than in others. In the South Atlantic division the ratio for the foreign-born white is almost four times as great as that for the native white; it is more than twice as great in the West South Central and Mountain divisions and almost twice as great in New England and the West North Central division. In the other divisions—the Middle Atlantic, the East North Central, the East South Central, and the Pacific—the one ratio is only about 50 per cent greater than the other.

Before accepting the difference in the ratio of commitments as an index of the relative criminality of the two classes of population, it should be remembered that the foreign-born white population as compared with the native white is concentrated in cities to a much greater extent and includes a larger percentage of males and of adults. The influence of the difference between the two classes as regards age and sex composition is considered in detail in another connection (see pp. 118 and 121); but it may be noted here that 56.4 per cent of the foreign-born white population in 1910 were males as compared with 50.7 per cent of the native white population and that 94.9 per cent of the foreign-born white male population were 15 years of age or over as compared with 63.5 per cent of the native white male population. If the age limit below which the individual is incapable of committing a penal offense be taken as 10 years, then 25 per cent of the native white population come below that limit, as compared with only 3 per cent of the foreign-born white population. That this difference in age composition goes far towards accounting for the difference between the native and foreign born as regards the ratio of commitments to prisons, jails, and reformatories is proved by the fact that if the ratio is based not on the total population but on the population 15 years of age or over, the ratio for the foreign-born white (791.7 per 100,000), instead of being twice as great, is only 1.4 times as great as that for the native whites (584.7 per 100,000). A fairer comparison, however, is that by age groups, which is presented later.

The difference between the native white and the foreign-born white as regards concentration in cities is shown by the following table:

Table 108

DIVISION.	PER CENT LIVING IN URBAN COMMUNITIES: 1910.	
	Native white population.	Foreign-born white population.
United States	44.2	72.2
New England	79.6	92.4
Middle Atlantic	66.3	83.9
East North Central	48.4	71.4
West North Central	31.6	39.2
South Atlantic	25.6	66.0
East South Central	17.8	66.7
West South Central	21.6	39.2
Mountain	36.0	39.7
Pacific	55.8	61.3

Of the total foreign-born white population of the United States 72.2 per cent were living in urban communities in 1910, while the corresponding percentage for the native white population was only 44.2; and in every geographic division likewise the percentage of urban residents was larger for the foreign-born white than for the native white. In all probability this difference in the environment of the two classes is an influence which tends to make the ratio of commitments to penal and reformatory institutions higher for the foreign born than for the native, although it is not possible to determine statistically just how great the effect of this influence is.

The ratios presented in Table 107 were based on the total number of prisoners reported as of native and foreign birth, respectively; but, as already pointed out, in some of the geographic divisions no return of nativity was received for a considerable proportion of the prisoners committed and in such divisions the ratios

based on the number for whom returns were received must be considerably below the true ratios. The ratios may properly be revised by distributing the number whose nativity was not reported on the basis of the proportion of native and of foreign born in the total number for whom it was reported. Although this revision will not alter the relative difference between the ratio for the foreign born and that for the native within the same division, since each ratio will be increased by exactly the same percentage, it will affect the ratios in some divisions more than in others and therefore make some difference in the relative size of the ratio in one division as compared with another. The effect of thus apportioning the "not reported" class is shown by the following table, which gives first the unrevised ratios based simply on the number of white prisoners and juvenile delinquents reported as native and foreign born, respectively, and then the revised ratio computed after those whose nativity was not reported have been apportioned between the native and foreign born on the basis of the percentages native and foreign born in the total number whose nativity was reported.

Pacific	578.8	844.6	741.3	1,081.3	2	4	1	4

[1] Number of prisoners and juvenile delinquents committed in 1910 per 100,000 population of the same race and nativity.
[2] Based on the number reported as native and foreign born, respectively.
[3] In computing these ratios a proportionate number of those whose nativity was not reported has been included, as explained in the text preceding the table.

The apportionment of those whose nativity was not reported of course makes the revised ratios for each nativity class larger than the original. In New England and the Middle Atlantic division the change is very slight, however, because the number whose nativity was not reported was small, but in the other divisions it is more pronounced, and it is especially so in the West South Central, Mountain, and Pacific divisions. This results in some change in the rank of the several divisions in respect to the ratios for either class as indicated in the last four columns of the above table. For instance, in respect to the unrevised ratio of commitments for the native white New England ranks first, but according to the revised ratio it ranks third, the Pacific division ranking first and the Mountain division second; the Middle Atlantic division ranks fourth in each case. In the case of the foreign-born white the order is practically the same as regards the revised and unrevised ratios, the Mountain division showing the highest ratio in each instance, followed by New England, the South Atlantic division, and the Pacific division, in the order named.

Although there is only one division, the West North Central, whose rank as regards the revised ratio of commitments is the same for the native white as it is for the foreign born, the general similarity in the order of the divisions as determined by the revised ratio for each class of prisoners is indicated by the fact that in five divisions the rank for the native white differs from that for the foreign-born white by only one place. This general correspondence in rank simply indicates that the ratio of commitments for either class is partly a matter of location or environment, which of course would be expected, as the relative number of prison and jail commitments in any community is largely determined by local influences or conditions which affect all classes, one of the most important of these influences being the provisions of the local statutes or ordinances regarding the penalization of minor offenses.

Table 110, on the following page, shows by divisions and states the coefficient of difference between the native white and the foreign-born white as regards the ratio of commitments per 100,000 population.

Comparing the figures by states, given in Table 110, it may be noted that in every state except Kentucky, Alabama, Utah, and Nevada the coefficient of difference was greater than 1, indicating that the ratio of commitments for the foreign-born white was greater than that for the native white; but in most states the coefficient was at the same time less than 2, indicating that the ratio for the foreign-born white came short of being twice as great as that for the native.

In 23 states the coefficient ranged from 1.1 to 1.6. In five of these states it was 1.4, or in other words the ratio for the foreign-born white in these states was 40 per cent greater than that for the native white. This may be regarded as a normal or typical relationship in view of the fact that there are a large number of states for which the coefficients approximate closely to 1.4 while for the other states the coefficients vary widely, showing no similar concentration around any one figure. The widest range of variation was in the South, where the coefficient varied from 0.7 in Alabama to 11.1 in North Carolina. Outside the South the range was from 0.9 in Utah to 3.7 in Arizona. Excluding the Western states (the Mountain and Pacific divisions) as well as the South, the range was from 1.1 in Iowa and Indiana to 2.8 in Maine.

[1] Number committed per 100,000 population of the same race and nativity.

Attention is naturally attracted by the conspicuously high coefficient for the state of North Carolina, indicating that the ratio for the foreign born in that state was eleven times as great as that for the native. The difference is perhaps not especially significant for the reason that this state has only a very small foreign-born population—in fact, the smallest number and the smallest proportion of foreign-born white reported from any state. The ratio of commitments for the foreign-born white in this state was not exceptionally high, the contrast as compared with the ratio for the native white resulting from the fact that the latter ratio was exceptionally low, being only 37.9. This low ratio is doubtless explained in part by the fact that the native white population of that state is mainly a rural population. That this is not a complete explanation, however, is indicated by the fact that some of the other Southern states (for example, South Carolina and Mississippi) have a percentage of rural population that is almost as large or larger and yet show a considerably higher ratio of prison and jail commitments for the native white.

CLASS OF INSTITUTION.

In Table 111 the white prisoners and juvenile delinquents committed to each class of institutions are classified by nativity.

The percentage foreign born was 22.8 among white prisoners and juvenile delinquents committed to state and Federal prisons and penitentiaries, 21.1 among those committed to reformatories for adults or for adults and juveniles, 9.2 among those committed to juvenile reformatories, and 30.4 and 20.3, respectively, among those committed to county and to municipal jails. A partial explanation of the high percentage for county jails as compared with municipal jails is found in the fact that a much larger proportion of the foreign-born prisoners committed than of the native were residents of the New England and Middle Atlantic divisions, where municipal jails are relatively few and are located for the most part in the smaller cities. It may be noted, moreover, that in the commitments to municipal jails the percentage of prisoners whose nativity was not reported is considerably larger than it is in the county jail commitments, with the result that the percentages reported as native and foreign born in the former class of commitments are more deficient than in the latter. In the Pacific division data regarding nativity were lacking for 34.5 per cent, or more than one-third, of the white prisoners and juvenile delinquents committed to municipal jails. This of course indicates that the court and jail officials take little pains to secure personal data regarding this class of offenders, most of whom probably were committed for drunkenness or other minor offenses. In the case of the county jails the returns, as already noted, were less deficient and in the case of state prisons they were practically complete.

[3] Per cent not shown where base is less than 100.

OFFENSE.

In Table 112, on the following page, the white prisoners and juvenile delinquents committed in 1910 are classified by nativity and offense. The table shows the per cent distribution by nativity of the total number committed for each offense and the per cent distribution by offense of the total number committed in each nativity class. It shows also for the native white and the foreign-born white, respectively, the ratio of commitments per 100,000 population for each offense, with the coefficient of difference.

[1] Number committed per 100,000 population of the same race and nativity. [2] Based on ratios carried out to the third decimal place.
[3] Less than one-tenth of 1 per cent.

The foreign-born white, as already noted, represented 16.3 per cent of the total white population in 1910 and 26.1 per cent of the total number of white prisoners and juvenile delinquents committed during that year. As shown by Table 112, they represented 36 per cent of the white prisoners and juvenile delinquents committed for assault, 31.2 per cent of those committed for lesser homicide, and 28.4 per cent of those committed for drunkenness and disorderly conduct. In no other offense group did the percentage foreign born exceed 25, although for every class of offenses except forgery and those offenses peculiar to children the percentage foreign born was greater than in the total white population.

Of the total number of foreign-born white prisoners and juvenile delinquents committed in 1910, 62.5 per cent were convicted of drunkenness or disorderly conduct, the corresponding percentage for the native white being 54.6. Of the former, 4.8 per cent were convicted of assault, as compared with 3.1 per cent of the latter. There is no apparent difference between the two classes as regards the percentage convicted of grave or lesser homicide. As regards each of the other specific offenses the percentage of the total number of commitments was larger for the native white than for the foreign born. This classification by offense thus indicates that a considerably larger proportion of the foreign-born white offenders than of the native are committed for drunkenness and disorderly conduct, offenses which are ordinarily punished by relatively short terms of imprisonment. These figures, therefore, are consistent with the fact that the average term of sentence for the United States as a whole, as shown by figures presented elsewhere, is shorter for the foreign-born white than for the native, and the further fact that the percentage foreign born is larger in the prison commitments during the year than in the prison population on a given day.

Comparing the ratios of commitments which are shown in the above table, it will be found that convictions for assault are proportionately three times as numerous among the foreign-born white as among the native white, and convictions for lesser homicide and for drunkenness and disorderly conduct more than twice as numerous. As regards the other offenses the difference is not so great; but there are only two instances in which the ratio is smaller for the foreign-born white than for the native white, one being the offense of forgery and the other the group of offenses peculiar to children. An explanation of the latter exception is found in the fact that the foreign-born population include a comparatively small number of children, the arriving immigrants being mostly adults and the children born of immigrants in this country being of course natives. That forgery should also be an exception may be explained by the fact that the opportunities and temptations for the commission of this offense are usually associated with occupations or positions in which immigrants are not very generally employed, and the further fact that this offense, unlike most of the other offenses, implies some degree of education, or at least the ability to write, which is more frequently lacking among the foreign born than among the native.

Table 113 presents figures for the North, South, and West corresponding to those presented for the United States in Table 112.

[1] Number of prisoners and juvenile delinquents committed in 1910 per 100,000 population of the same race and nativity.

In Table 114 ratios of commitments for the native and foreign-born white in each geographic division are shown for two classes, one consisting of cases of drunkenness and disorderly conduct and the other including all other offenses.

In every geographic division the difference between the native and the foreign-born white in the ratio of commitments is more marked for drunkenness and disorderly conduct than for other offenses. One reason may be that the foreign-born white as compared with the native white are concentrated to a greater extent in cities, where probably commitments for drunkenness are relatively of more frequent occurrence than in the rural districts.

SENTENCE.

In the following table the native and foreign-born white prisoners and juvenile delinquents committed in 1910 are classified with respect to the general character of the sentence imposed and those committed under sentence of imprisonment without fine are further classified by length of sentence.

Nature of sentence not reported	1,082	535	122	425	49.4	11.3	39.3	0.3	0.2	0.1	1.5

[1] Per cent not shown where base is less than 100.

[2] Less than one-tenth of 1 per cent.

The percentage foreign born in the different classes of white prisoners as determined by the general nature of the sentence did not vary greatly, being 26.8 for those sentenced to imprisonment without fine, 24.5 for those sentenced to imprisonment and fine, and 25.9 for those imprisoned for nonpayment of fine, or not far from one-fourth of the total number in each class. The proportion foreign born was also not far from one-fourth in the total number of white offenders sentenced to death. It should be noted, however, as regards the class imprisoned for nonpayment of fine, that the percentage foreign born is somewhat deficient because of the considerable proportion (10.3 per cent) of the white prisoners in this class whose nativity was not reported.

Among the white prisoners sentenced to imprisonment without fine for a term of less than one year the percentage foreign born (28.7) was much larger than it was among those similarly sentenced for a term of one year or longer or for life (21.5). The percentage reaches its maximum in the class sentenced for a term of from six months to one year, 35.8 per cent of this class being of foreign birth. The small percentage foreign born in the class sentenced for their minority is a natural result of the small proportion of children in the foreign-born population as compared with the native.

Table 116 brings out the fact that in the United States as a whole and in every geographic division the percentage committed for nonpayment of fine is larger among the foreign-born white offenders than among the native white. This may be partly because the foreign born as compared with the native are more

often unable to pay fines on account of poverty, but it is probably due in part also to the difference between the two classes as regards the relative number of minor offenses committed. As was shown by figures presented in the preceding section, a much larger proportion of the foreign-born than of the native white prisoners (62.5 per cent as compared with 54.6 per cent) were convicted of drunkenness and disorderly conduct, a class of offenses very commonly punished by fines.

The difference between the two classes as regards the percentage committed for nonpayment of fine was not, however, very marked for the United States as a whole or for the New England or Middle Atlantic divisions. It was much more pronounced in some of the western and southern divisions and was greatest in the Mountain division, where the percentage for the native white was 54.3 and for the foreign-born white 72.9.

Table 116 — WHITE PRISONERS AND JUVENILE DELINQUENTS COMMITTED IN 1910.

Indeterminate	11,643	4,308	24	11.8	11.3	0.4
Length of sentence not reported	502	90	47	0.5	0.2	0.8

The main difference between the native and the foreign-born white shown in the preceding table is that the latter includes a smaller percentage of sentences during minority and a larger percentage of short-term sentences (less than one year). The small percentage of sentences during minority for the foreign-born white is a natural result of the fact, already indicated, that the foreign-born population comprises a comparatively small percentage of minors. The percentage of indeterminate sentences is practically the same for the two classes; but the percentage of sentences for definite terms is larger for the foreign-born white, mainly because the percentage of sentences during minority is smaller.

The next table, however, shows that in every geographic division except the East South Central the percentage of indeterminate sentences is smaller for the foreign-born white than for the native white, although in the New England and Middle Atlantic divisions the difference is inconsiderable. The percentage is probably determined in part by the kind of offenses committed and in part by the geographic distribution of the two classes. The use of the indeterminate sentence varies widely in different states, and where employed it is ordinarily restricted to those more serious offenses which are penalized by commitments to state prisons or state reformatories.

[1] Includes figures for United States penitentiaries, which are not shown separately in this table.

In Table 119, on the following page, the native white and the foreign-born white prisoners and juvenile delinquents committed for life or for definite terms of imprisonment without fine are classified by length of sentence.

A larger proportion of the native white than of the foreign-born white were committed for terms of one year or more or for life (11.8 per cent of the former, as compared with 7.8 per cent of the latter). The percentage committed for terms of less than one month was also somewhat larger for the native white (38.6) than for the foreign-born white (34.3); but the percentage committed for terms of less than one year and more than

one month was 29.6 for the native white and 36.8 for the foreign-born white. Probably the difference is partly explained by the fact that a larger proportion of the foreign-born white than of the native white are found in cities, where as compared with the country there are in general relatively more commitments for minor offenses punishable by short terms of imprisonment. Another important factor, however, is the difference in the geographic distribution of the two classes, only a relatively small proportion of the foreign-born whites being found in the Southern states, where, as already pointed out, the average length of sentence is considerably above that for the rest of the United States.

[1] Less than one-tenth of 1 per cent.

A comparison by geographic divisions is presented in Table 120.

The figures for the geographic divisions exhibit no great degree of uniformity in the relationship between the sentence classification for the foreign born and that for the native. It will be found that in six divisions the percentage sentenced for less than one month was smaller for the foreign-born white than for the native; and in the same number of divisions the percentage sentenced for one month or more but less than one year was larger. The percentage sentenced for one year or more was smaller for the foreign-born white than for the native in five divisions and larger in three. In many instances the percentage for the foreign born differs but little from that for the native, while in other instances the difference is marked.

The approximate average length of sentence for the two classes—native and foreign-born whites—committed in 1910 is given in months in Table 121 for each geographic division.

Although for the United States as a whole the average length of sentence for the native white exceeds that for the foreign-born white, this is by no means true in all parts of the country. On the contrary, in the Middle Atlantic, East North Central, East South Central, Mountain, and Pacific divisions the average length of sentence is greater for the foreign-born white than for the native white, all of which goes to show that there is no uniform or general tendency towards a longer sentence for one class than for the other.

In the following table for states the white prisoners and juvenile delinquents committed under sentence of death or of imprisonment for life or a definite term without fine are divided into two main classes, those sentenced for less than one year and those sentenced for one year or over, the latter including those sentenced to death and to life imprisonment. The table shows the percentage foreign born in each of these two classes and also what percentage, respectively, of the native and of the foreign-born white prisoners and juvenile delinquents committed under sentence as above defined were sentenced to a term of one year or over.

[1] Includes those sentenced to death or to imprisonment for life.

[2] Per cent not shown where base is less than 100.

In the United States as a whole 21.5 per cent of the white prisoners and juvenile delinquents sentenced to definite terms of one year or longer (including those sentenced to death or life imprisonment) were foreign born, as compared with 28.7 per cent of those sentenced for less than one year; and of the white prisoners and juvenile delinquents here considered who were natives of the United States 11.9 per cent were sentenced for one year or longer, as compared with 7.9 per cent of those who were foreign born. Thus the table brings out the fact that there is a larger percentage foreign born among the short-term prisoners than among those committed for long terms and the related fact that the percentage of long-term prisoners is greater among the native than among the foreign-born white. But, as shown by the figures for geographic divisions and states, this relationship by no means holds good in all parts of the United States. It holds good, however, in the New England, West North Central, South Atlantic, and West South Central divisions. It is also true literally in the Middle Atlantic division, but practically the percentages in that division show no difference between the native and the foreign born in these respects. On the other hand, in the East North Central and the Mountain and Pacific divisions the percentage foreign born is larger among the long-term than among the short-term prisoners and the percentage of long-term prisoners larger among the foreign born than among the native white. A comparison of the figures by states reveals similar variations in these relationships.

AGE.

Reference has already been made to the fact that the age composition of the foreign-born white population differs materially from that of the native white in that a much larger proportion of the foreign born than of the native are adults. The difference is shown in the following table, in which the native white and the foreign-born white population are distributed by age groups:

Table 123

AGE.	WHITE POPULATION: 1910.			
	Native.		Foreign born.	
	Number.	Per cent distribution.	Number.	Per cent distribution.
All ages	68,386,412	100.0	13,345,545	100.0
Under 5 years	9,220,407	13.5	102,507	0.8
5 to 9 years	8,176,664	12.0	298,509	2.2
10 to 14 years	7,560,078	11.1	358,330	2.7
15 to 24 years	13,850,660	20.3	2,104,142	15.8
25 to 44 years	18,156,550	26.5	5,879,979	44.1
45 to 64 years	8,857,386	13.0	3,392,518	25.4
65 years or over	2,456,654	3.6	1,183,349	8.9
Age not reported	108,013	0.2	26,211	0.2

While 36.6 per cent of the native white population in 1910 were under 15 years of age, the corresponding percentage for the foreign-born white was only 5.7. The percentage under 25 years of age was 56.9 for the native and 21.5 for the foreign born. On the other hand, 69.5 per cent, or more than two-thirds, of the foreign-born white were from 25 to 64 years of age, as compared with 39.5 per cent, or only about two-fifths, of the native white. The percentage 65 years of age or over was also larger for the former (8.9) than for the latter (3.6).

It has already been pointed out (p. 108) that this difference in the age composition of the two classes, or the fact that a much larger proportion of the native population than of the foreign born are infants or children, goes far towards explaining why the ratio of commitments based on total population is higher for the foreign-born white than for the native white and why there is a larger percentage foreign born in the total number of persons committed to prisons and jails than in the total population. In view of this fact it is especially important that the data for the two classes should be presented in connection with age; and in the following table the classification of the white prisoners and juvenile delinquents by nativity is combined with a classification by age groups:

Table 124

AGE.	WHITE PRISONERS AND JUVENILE DELINQUENTS COMMITTED IN 1910.							Per cent foreign born in total white population: 1910.

25 to 34 years	97,424	69,927	26,144	1,353	71.8	26.8	1.4	23.4
35 to 44 years	84,630	57,568	26,022	1,040	68.0	30.7	1.2	25.8
45 to 54 years	51,457	32,962	17,944	551	64.1	34.9	1.1	27.2
55 to 64 years	20,949	12,639	8,082	228	60.3	38.6	1.1	28.5
65 years or over	7,152	3,545	3,520	87	49.6	49.2	1.2	32.5
Age not reported	36,503	10,562	1,944	23,997	28.9	5.3	65.7	19.5

The percentage foreign born in the total number of white prisoners and juvenile delinquents committed increases regularly with each successive age group. Thus of the youthful offenders of the white race 10 to 17 years of age only about 10 per cent were of foreign birth. But the percentage, as it increases, becomes 26.8 in the age group "25 to 34 years," advances to 30.7 in the next older group, "35 to 44 years," and finally reaches 49.2 in the oldest age group, "65 years or over." This increase is in part a natural consequence of the corresponding increase in the percentage foreign born in the total white population, which is shown in the last column of Table 124. The percentage foreign born is, however, invariably larger among white prisoners and juvenile delinquents than it is in the total white population in the same age group, which indicates that in every age group commitments to penal or reformatory institutions are

relatively more frequent in the foreign-born white population than in the native. The difference in this respect is best indicated by the figures in the following table showing the ratio of commitments per 100,000 population for the native and foreign-born white, classified by age periods.

Table 125 — WHITE PRISONERS AND JUVENILE DELINQUENTS COMMITTED IN 1910.

Age not reported	10,562	1,944	.....	.....	.....

[1] Number committed per 100,000 population of the same race, nativity, and age.

The difference in the ratio of commitments varies considerably at different ages. The contrast is most marked as regards the commitments of children, probably because a much larger proportion of the foreign-born population than of the native is resident in states where the policy of committing juvenile offenders to special institutions for this class for reformatory treatment is well established. In each year of age from 10 to 15, inclusive, the ratio of commitments for the foreign-born white is more than twice as great as that for the native white, but from 15 to 24, inclusive, it is about one and one-half times as great. The difference is still smaller in the age periods from 25 to 44, but increases in the older age periods; and in the oldest period, "65 years or over," the ratio of commitments for the foreign-born white is again more than twice as great as that for the native white.

That the contrast between native and foreign born as regards the ratio of commitments should be greater in old age than in middle life is consistent with the fact—shown by statistics previously presented—that a larger proportion of the foreign-born prisoners than of the native are committed for drunkenness and disorderly conduct, taken in connection with the further fact that the prisoners committed for drunkenness are as a class much older than those committed for other offenses. Differences in economic status and degree of education may, however, be reflected in the statistics here presented. The immigrants as compared with the native Americans include a relatively larger number of manual laborers without education and therefore as a class are less likely to have made any provision for old age and are more likely to be "shelved" as they grow older and to become drifters or vagrants. Perhaps that is one reason why the difference between the native and the foreigner as regards the ratio of prison commitments becomes more marked in old age and is least marked in the period of maximum physical strength and activity, namely the period from 25 to 44. The conjecture implies of course that the ratio of prison or jail commitments for any class is determined in some degree at least by economic status. In the period of early middle life the immigrant as compared with the native is least handicapped by his poverty and ignorance. As long as his physical strength remains unimpaired he can secure remunerative employment and take care of himself and his family; but as old age comes on he finds it increasingly difficult to obtain a livelihood, and is therefore at a greater disadvantage as compared with the average native American, who presumably possesses more property and is better educated. Old age, in short, is probably more of an economic handicap to the immigrant than to the native, and that may explain in part why the ratio of commitments to prisons and jails, although it decreases for both classes in old age, decreases more gradually for the immigrant than for the native, with the result that the difference between them in this respect becomes more pronounced.

Another possible influence which should be considered in this connection, however, is the fact that, owing to the changes which have taken place as regards the sources of immigration to the United States, the racial composition of the foreign-born element in the older age groups differs considerably from that in the younger groups. The earlier immigration came mainly from the northern and western countries of Europe; the later largely from the southeastern countries. The composition of the older age groups in the foreign-born population reflects that of the earlier immigration, because most of the more recent immigrants are found in the younger age groups. But what the effect of this difference may be upon the ratio of prison commitments is not easy to determine. It is sometimes contended that the later immigration is of a less desirable character than the earlier; and yet it is possible that the vice of drunkenness, which, as we must continually remind ourselves, accounts for a large proportion of the prison and jail commitments, may be more prevalent among the survivors of the earlier immigration than among the later arrivals.

The above comparison by age periods establishes the fact that the higher ratio of commitments shown for the foreign-born white population as compared with the native is not entirely due to the difference in the age composition of the two classes, since the ratio is higher for the foreign born than for the native in every age group. It is significant, however, that from the age of 16 up to that of 65 the difference between the

native and foreign born is less than it is in the total for all ages, indicating that the difference in the total is in part at least the result of differences in age distribution, or of the fact already noted that the native white population as compared with the foreign born includes a relatively large proportion of very young children and infants incapable of committing a penal offense in the legal sense of the term.

The extent to which the difference between the ratios for all ages combined is a result of the difference in age composition may be determined approximately by the results of a computation[1] showing what the ratio of commitments for the foreign-born white would be if their age distribution was the same as that of the native white and at the same time the ratio of commitments within each age group remained unchanged. On that assumption the ratio for the foreign-born white would be 506 per 100,000, whereas the actual ratio is 746.6. The hypothetical ratio, instead of being, like the actual ratio, twice as great as that for the native white, is hardly more than one and one-third times as great. Thus almost two-thirds of the difference between the native and the foreign-born white as regards the relative numbers committed to prisons and jails is due to the difference in age composition.

Table 126 gives the ratio of commitments per 100,000 population for the native white and foreign-born white by age periods for each geographic division. The numbers committed are shown in General Table 35 (p. 350).

Table 126

RATIO OF WHITE PRISONERS AND JUVENILE DELINQUENTS COMMITTED IN 1910 PER 100,000 WHITE POPULATION OF SAME RACE, NATIVITY, AND AGE.

AGE.	United States.		New England division.		Middle Atlantic division.		East North Central division.		West North Central division.

Although as a rule the ratio of commitments is distinctly higher for the foreign-born white than for the native white in every age period, there are some noteworthy exceptions. In the Middle Atlantic division the ratio for the native white is greater than that for the foreign-born white in the age periods "21 to 24 years," "25 to 34 years," and "35 to 44 years;" this is also the case in New England as regards the age periods "18 to 20 years" and "25 to 34 years," and in the East North Central division as regards the age period "35 to 44 years." In most divisions the difference between the two classes is less marked in the age groups between 21 and 44 than it is in younger and older groups; and in four divisions—the New England, Middle Atlantic, East North Central, and Pacific—the ratio for the native white between these ages either exceeds that for the foreign-born white or does not fall much below it.

Table 127 gives for each geographic division, by age groups, the coefficient of the difference between the native white and the foreign-born white as regards the ratio of commitments, this coefficient, as already explained, being the quotient obtained by dividing the ratio for the foreign-born white by that for the native white.

[1] The computation consists simply in multiplying the total native white population in each age group by the ratio of commitments for the foreign-born white in the same age group, adding the products and dividing the total thus obtained by the total native white population. The result shows what the ratio of commitments for the foreign-born white would be if the ratio for the foreign-born white in each age group had the same weight in determining the total ratio that the ratio for the native white in each age group has in determining the total ratio for the native white.

Table 127 — COEFFICIENT OF DIFFERENCE BETWEEN THE RATIO OF COMMITMENTS FOR FOREIGN-BORN WHITES AND THAT FOR NATIVE WHITES.[1]

AGE.	United States.	New England division.	Middle Atlantic division.	East North Central division.	West North Central division.	South Atlantic division.	East South Central division.	West South Central division.	Mountain division.	Pacific division.

[1] The ratio of commitments represents the number of prisoners and juvenile delinquents committed in 1910 per 100,000 population of the same race, nativity, and age, and the coefficient of difference here given is the quotient obtained by dividing the ratio for the foreign-born white by that for the native white.

The instances already mentioned in which the ratio for the native white is higher than that for the foreign born are here represented by a coefficient below 1. The tendency for the coefficient to increase in the older age groups is more pronounced in New England than in any other division, but is apparent to some degree in every division except the West North Central. In general, although not invariably, the coefficients are somewhat larger in the age groups under 21 and over 45 than in those from 21 to 44.

SEX.

In the following table the white prisoners and juvenile delinquents enumerated on January 1, 1910, and also those committed during the year, are classified by sex and nativity:

Table 128 — WHITE PRISONERS AND JUVENILE DELINQUENTS: 1910.

SEX.	Enumerated January 1.				Committed during the year.			
	Total.	Native.	Foreign born.	Nativity not reported.	Total.	Native.	Foreign born.	Nativity not reported.
	NUMBER.							
Both sexes	93,841	71,841	20,970	1,030	382,052	253,929	99,639	28,484
Male	85,218	64,807	19,450	961	354,367	236,151	90,850	27,366
Female	8,623	7,034	1,520	69	27,685	17,778	8,789	1,118
	PER CENT DISTRIBUTION BY SEX.							
Both sexes	100.0	100.0	100.0	100.0	100.0	100.0	100.0	100.0
Male	90.8	90.2	92.8	93.3	92.8	93.0	91.2	96.1
Female	9.2	9.8	7.2	6.7	7.2	7.0	8.8	3.9
	PER CENT DISTRIBUTION BY NATIVITY.							
Both sexes	100.0	76.6	22.3	1.1	100.0	66.5	26.1	7.5
Male	100.0	76.0	22.8	1.1	100.0	66.6	25.6	7.7
Female	100.0	81.6	17.6	0.8	100.0	64.2	31.7	4.0

As shown by the above table, 9.8 per cent of the native white prisoners enumerated on January 1, 1910, and 7 per cent of those committed during the year, were females. For the foreign-born white the corresponding percentages were 7.2 and 8.8, respectively. Thus in the case of the native white the percentage of females was larger in the prison population than in the prison commitments, while in the case of the foreign-born white the higher percentage of females was that for the commitments. The difference is probably not especially significant but may indicate that among the foreign-born white the average term of imprisonment is somewhat longer for males than for females but that among the native white it is longer for females than for males. This, it may be well to point out, would not necessarily mean that in the native white population relatively more of the female offenders than of the male were committed for serious offenses, or that they were punished by relatively longer sentences for the same offenses. It may result from the fact that a larger proportion of the female offenders than of the male were committed to reformatories, where the term of confinement is not determined primarily by the gravity of the offense.

The same general relationship as that pointed out in the preceding paragraph is shown in the per cent distribution by nativity, the percentage foreign born being greater among males (22.8) than among females (17.6) in the prison population but greater among females (31.7) than among males (25.6) in the prison commitments. For either sex the percentage foreign born is greater in the commitments than in the prison population, indicating a shorter average term of imprisonment for the foreign born than for the native.

As shown by Table 129 below, the contrast between the native and foreign-born white as regards the relative numbers committed to prisons and jails is more marked for the female sex than it is for the male, the ratio of commitments for foreign-born white males being less than twice as great as that for native white males, while the ratio for foreign-born white females is nearly three times that for native white females.

Table 129 — WHITE PRISONERS AND JUVENILE DELINQUENTS COMMITTED IN 1910.

SEX.	Number.		Ratio of commitments.[1]		
	Native.	Foreign born.	Native.	Foreign born.	Coefficient of difference.
			A	B	B÷A
Both sexes	253,929	99,639	371.3	746.6	2.0
Male	236,151	90,850	681.4	1,207.5	1.8
Female	17,778	8,789	52.7	151.0	2.9

[1] Number committed per 100,000 population of the same race, nativity, and sex.

The ratio for males alone, it may be noted, is much higher than that for both sexes combined. In other words, the elimination of females increases the ratio

very materially, and naturally so simply because the proportion of females among prisoners is small as compared with the proportion of females in the total population. The effect is greater relatively, however, on the ratio for the native white than on that for the foreign born, the result being that the difference between the two classes, as shown by the coefficient, is less for males alone than for both sexes combined.

In the next table the white prisoners and juvenile delinquents of each sex committed in 1910 in each geographic division are classified by nativity, the table showing also the ratio of commitments per 100,000 population for the native and foreign-born white by sex and the percentage native and foreign born, respectively, in the total number of white offenders of either sex.

Table 130 — WHITE PRISONERS AND JUVENILE DELINQUENTS COMMITTED IN 1910.

[1] Number committed per 100,000 population of the same race, nativity, and sex.
[2] Includes figures for United States penitentiaries, which are not shown separately in this table.

The above table shows the percentage foreign born in the total number of white prisoners and juvenile delinquents of each sex (column 8) and also the percentage foreign born in the total number of those of each sex whose nativity was reported (column 5). The latter percentage naturally differs considerably from the former in those divisions such as the West South Central where the number for whom no report as to nativity was obtained was large.

For the United States as a whole the percentage foreign born, as already noted, was considerably larger among the female white prisoners and juvenile delinquents committed than among the male. There are, however, only two individual geographic divisions in which this is true, namely, the New England and Middle Atlantic divisions. In New England 50.1 per cent of the female white prisoners and juvenile delinquents committed in 1910 (excluding those whose nativity was not reported), and 40.6 per cent of the male, were foreign born; in the Middle Atlantic division the corresponding percentages were 42.3 and 32.5, respectively. In the Mountain division, on the other hand, the percentage was 24.7 for females as against 33.9 for males; and in the Pacific division it was 22.3 as against 28.7. It may be noted in this connection that in the general population the percentage foreign born in 1910 was greater among white males than among white females (17.8 as compared with 14.7), which would partially account for the fact already noted that the percentage is in most divisions greater among the white males in the prison commitments than among the white females. The relationship between the general population and the commitments is, however, best indicated by the ratio of commitments and coefficient of difference, as shown in the above table. In every division the ratio of commitments for the foreign-born white of either sex is higher than for the native white of the same sex; and in all except the West North Central, the South Atlantic, and the East South Central the difference is greater for females than for males.

SEX AND OFFENSE.

Table 131 classifies the white prisoners and juvenile delinquents by sex, nativity, and offense, and shows the per cent distribution by nativity for each sex and each offense. In the case of males it will be found that the percentage distribution by nativity in the several offense groups differs very little from the corresponding distribution for both sexes combined as shown in Table 112 (p. 112). For instance, as shown by that table, 36 per cent of the total number of white offenders convicted of assault were of foreign birth and, as shown by the table presented here, the corresponding percentage for male white offenders was 36.2. Of course, this correspondence is simply the result of the fact that the great majority—more than 90 per cent—of the white offenders committed were males; consequently the figures for both sexes combined do not differ materially from those for males alone.

In the case of females the number of commitments for many offenses was so small that the per cent distribution by nativity is not shown in the table. But among those offenses or offense groups for which percentages are shown it appears that there are two in which the percentage foreign born was greater among males than among females, namely, assault and the group of offenses peculiar to children. Of the white male offenders convicted of assault, 36.2 per cent were foreign born, as compared with 28.2 per cent of the white female offenders convicted of the same offense. For the group of offenses peculiar to children the corresponding percentages were 9.8 and 5.2, respectively. On the other hand, where the offense was larceny 31.1 per cent of the white female offenders committed were foreign born, as against 21.3 per cent of the male. For drunkenness and disorderly conduct the percentage foreign born was 38.4 among females as against 27.6 among males. For vagrancy the corresponding percentages were 25.8 and 22.2, respectively.

[1] Number committed per 100,000 population of the same race, nativity, and sex.
[2] It may be noted that the coefficient is not always the figure obtained by dividing the ratio for the foreign-born white by that for the native white as given in the table This is because in computing the coefficient the ratios when small were carried out for three or more decimal places in order to obtain more exact results.
[3] Less than one-tenth of 1 per cent.
[4] Per cent not shown where base is less than 100.
[5] Less than 1 per 100,000.

Table 131 shows also the ratio of commitments per 100,000 population of the native and foreign-born white, by offense, for each sex separately.

As regards most of the offense groups distinguished in the table the ratio of commitments for females was so small that the difference between the native and foreign-born white is not especially noteworthy. But as regards drunkenness and disorderly conduct it may be noted that the ratio of commitments for foreign-born white females was about four (3.8) times that for native white females, while in the case of males the ratio for the foreign-born white was only twice that for the native. It follows that the contrast between the sexes as regards commitments for drunkenness and disorderly conduct is greater in the native than in the foreign-born population, the ratio of commitments for males in the native white population being about 12 times that for females, while in the foreign-born white population the one ratio is less than seven times the other. While these ratios can not be accepted as very reliable indices of the actual prevalence of drunkenness in the different classes here compared, they probably indicate that the difference between the sexes as regards the use of alcoholic drinks is greater in the native population than in the foreign born.

In the following table, presenting figures for geographic divisions, the white prisoners and juvenile delinquents are divided with respect to offense into two groups, those committed for drunkenness and disorderly conduct and those committed for all other offenses. The classification by nativity is shown for each group, with the percentage reported as foreign born.

[1] Includes figures for United States penitentiaries, which are not shown separately in this table.

In every division with three exceptions the percentage foreign born is larger among the white offenders of either sex committed for drunkenness or disorderly conduct than it is among those of the same sex committed for other offenses. The exceptions noted occur in the Middle Atlantic division in the case of male offenders and in the two south central divisions in the case of female offenders.

In the New England, Middle Atlantic, East North Central, and Pacific divisions the percentage foreign born is larger among white female offenders committed for drunkenness or disorderly conduct than it is among white male offenders committed for the same class of offenses. The divisions in which this is not the case include the three southern divisions, where the percentage foreign born is small; the West North Central, in which the percentages for the two sexes are nearly the same; and the Mountain division, in which the percentage is distinctly larger for males than for females.

As regards the white offenders committed for offenses other than drunkenness and disorderly conduct the percentage foreign born is larger among males than among females in every geographic division except New England and the Middle Atlantic division; in the latter division there is not much difference between the sexes in this respect but in New England the percentage foreign born is somewhat larger among the female offenders of this class than among the male.

SEX AND AGE.

The table which follows gives by age groups the number of native and foreign-born white males and females committed, with the ratio per 100,000 population and the coefficient of difference between the ratios for each sex and age group.

Table 133

Female	1,573	656	84	833	41.7	5.3	53.0	.....	.....	.....

[1] Number committed per 100,000 population of the same race, nativity, sex, and age.

[2] Per cent not shown where base is less than 100.

In every age group the ratio of commitments for the foreign-born white males is higher than that for the native white males. But the difference diminishes and almost disappears in early middle life, the ratio in the age group "25 to 34 years" being hardly higher for the foreign-born white than for the native white. In the next older age group, "35 to 44 years," the difference is still not very great. In other words, between the ages of 25 and 45 the tendency to commit penal offenses appears to be not much greater among immigrant males than among native. After the age of 45 the difference becomes more pronounced, the ratio for the foreign-born white as compared with that for the native white being about one and one-fourth times as great in the age group "45 to 54 years," one and one-half times as great in the age group "55 to 64 years," and almost twice as great in the oldest age group, "65 years or over." This same phenomenon appears in the ratios by age groups for both sexes combined and its possible significance or explanation is considered in that connection (p. 119).

In none of the age groups between 10 and 25 is the ratio of commitments for foreign-born white females much larger than that for the native white; in the age group "15 to 17" it is in fact slightly smaller. But in the successive older age groups above 25 the difference increases very rapidly, as is indicated by the coefficient in the last column of the table, the increase being much more pronounced than it is in the case of males.

Table 134 gives the ratio of commitments per 100,000 population for native and foreign-born white males by age and geographic divisions, while the corresponding ratios for females are given in Table 135. The respective numbers of commitments are given in General Tables 36 and 37 (pp. 352 and 354).

The comparison by geographic divisions shows that the relation between the native and the foreign-born white is about the same for males alone as it is for both sexes (see p. 120), that is to say, while the ratio for the foreign born is, in general, higher than that for natives whether the comparison is restricted to males or includes both sexes, notable exceptions to this general rule occur in four divisions (the New England, Middle Atlantic, East North Central, and Pacific) in some of the age groups between 18 and 55. In fact, in the ages between 21 and 55 the ratio of commitments is either smaller for the foreign-born males than for the native or is not much larger in all divisions except the three southern—in which there are relatively few foreign born—and the Mountain divisions. This is shown more clearly by Table 136, which gives the coefficient of difference for males.

Table 136 — COEFFICIENT OF DIFFERENCE BETWEEN THE RATIO OF COMMITMENTS IN 1910 FOR FOREIGN-BORN WHITE MALES AND THAT FOR NATIVE WHITE MALES.[1]

AGE.	United States.	New England division.	Middle Atlantic division.	East North Central division.	West North Central division.	South Atlantic division.	East South Central division.	West South Central division.	Mountain division.	Pacific division.
All ages	1.8	1.7	1.3	1.4	1.7	3.3	1.4	2.4	2.0	1.2

[1] The ratio of commitments represents the number of prisoners and juvenile delinquents committed in 1910 per 100,000 population of the same race, nativity, and age, and the coefficient of difference here given is the quotient obtained by dividing the ratio for the foreign-born white males by that for the native white males.

In the case of males, as just noted, exceptions to the general rule that the ratio of commitments is higher for the foreign born than for the native white occur in the age groups between 18 and 55; in the case of females, however, the exceptions nearly all occur below the age of 25, and in most of the geographic divisions, just as in the country as a whole, the disparity between native white females and foreign-born white females increases very rapidly above that age, reaching its maximum as a rule in the period of old age. This relationship is shown more directly by the coefficients of difference obtained by dividing the ratios for the foreign born by those for the native and presented in Table 137. In every division except the West South Central and Mountain the coefficient increases in general to a marked degree in the age groups above the age of 25.

Table 137 — COEFFICIENT OF DIFFERENCE BETWEEN THE RATIO OF COMMITMENTS IN 1910 FOR FOREIGN-BORN WHITE FEMALES AND THAT FOR NATIVE WHITE FEMALES.[1]

[1] Exclusive of those reporting their mother tongue as Polish.
[2] Persons born in Austria, Germany, and Russia reporting Polish as their mother tongue.
[3] Includes cases where country of birth was not reported.

As shown by the above table, 26,819, or more than one-fourth, of the foreign-born white prisoners and juvenile delinquents committed in 1910 were born in Ireland, although natives of that country represented only about 10 per cent of the total foreign-born white population of the United States. Natives of Germany formed 8.9 per cent of the foreign-born white prisoners and juvenile delinquents, as compared with 17.3 per cent of the total foreign-born white population. The relative number committed to prisons and jails among those born in the respective countries is, however, best indicated by the last column in the above table, showing the ratio of commitments or number of persons born in each country among prisoners and juvenile delinquents per 100,000 born in the same country in the total population.

It may be noted that the list of countries given in the above table includes Poland, although in a political sense there was no such country in existence in 1910. Presumably, however, the prisoners reported as born in Poland were Poles by race who were born in the Polish provinces of Austria, Germany, or Russia, which once formed territorially the independent country of Poland. Accordingly, for the purposes of computing the ratios in the tables which follow, persons of the Polish race or Polish mother tongue reported in the population census as born in Austria, Germany, or Russia have been deducted from the total number of persons born in these countries and classified separately as natives of Poland.

The highest ratio of commitments per 100,000 was that shown for the natives of Mexico (2,336.2). The natives of Ireland showed the next highest ratio (1,983.4) and the natives of Scotland the third highest (1,196). The lowest ratio was that for the Swiss (313.2 per 100,000), and the two next lowest were those for the natives of Germany (383.4) and of Denmark (390.4). The ratios thus exhibit a very wide range of diversity. As instances of some of the more striking contrasts it may be noted that in proportion to their numbers the Irish were committed about five times as frequently as the Germans and the Scotch twice as frequently as the Italians.

Although such differences as these are no doubt indicative of differences in national traits or habits, it should be remembered that other factors affect the figures and that the ratio of commitments can not without qualification be accepted as an index of the innate tendency to criminality, vice, or dissipation. One of the other factors, the importance of which has already been emphasized, is the influence of locality and especially the difference between an urban and a rural environment. The percentage living in urban communities (defined as incorporated cities, boroughs, etc., having not less than 2,500 inhabitants) for each of the several nationalities in 1910 was as follows:

Austria	72.4	Ireland	84.7
Canada, English	69.3	Italy	78.1
Canada, French	81.3	Mexico	34.2
Denmark	48.3	Norway	42.2
England and Wales	72.0	Russia	87.0
France	69.9	Scotland	72.4
Germany	66.7	Sweden	60.6
Hungary	77.3	Switzerland	53.9

Of those born in Ireland 84.7 per cent were living in urban communities in 1910, while the corresponding percentage for the Germans was 66.7 and for the Danes 48.3. This may be one reason why the ratio of commitments is so much higher for the Irish than it is for the other two nationalities. But, on the other hand, the Mexicans—the nationality showing the highest ratio of commitments—had the smallest percentage living in cities; and the natives of Russia, for whom the percentage living in cities was largest, had a comparatively low ratio of commitments. Evidently it is not altogether a question of environment.

GEOGRAPHIC DIVISIONS.

There are wide differences also in the territorial distribution of the various foreign nationalities within the United States. The Irish, French Canadians, Italians, and Russians are largely concentrated in the northeast, within the territory covered by New England and the Middle Atlantic division, while the majority of the Scandinavian nationalities are located in the Middle West, represented by the two North Central divisions. Of those born in Germany about one-third are living in the East North Central division, and almost as large a proportion in the Middle Atlantic division, but less than 3 per cent in New England. Of course, it is probable that these differences have some effect upon the ratio of commitments shown by totals covering the entire United States. Table 139, however, presents figures by geographic divisions showing for each division the number and ratio of commitments in the white population born in each specified foreign country, while Table 140 shows the rank of the several nationalities as regards the ratio of commitments in each division. It will be noted as regards some of the nationalities that their rank in the several divisions is fairly uniform while in the case of others there is a rather wide range of variation. In some instances, however, as will be seen by reference to Table 139, the representation of the nationality in the population of a given division is so small that the ratio and the rank are not very significant.

[1] The ratio referred to is the number of foreign-born white prisoners and juvenile delinquents committed in 1910 per 100,000 white population born in the same country.

OFFENSE.

In General Table 58 (p. 415) the commitments in 1910 of natives of each of the more important foreign countries are classified with respect to offense; the per cent distribution by offense is shown in Table 141.

In the case of each nationality a large proportion of the total number of commitments reported represent cases of drunkenness or disorderly conduct. Three-fourths of the offenders born in Ireland and in Sweden were committed for these offenses. For the natives of Italy the proportion was less than one-third (30 per cent). On the other hand, the proportion of commitments for assault was larger among the Italian offenders (12.8 per cent) than for any other nationality. But this of course does not necessarily mean that in proportion to their numbers in the total population the Italians are committed for assault more frequently than other nationalities, since the percentages just cited are based on the total number of offenders and not on the total population.

[1] In computing the ratios shown persons reporting their mother tongue as Polish were excluded from the total population born in the specified country.
[2] See p. 128 for explanation regarding Poland as a country of birth.
[3] Includes cases where country of birth was not reported.
[4] Less than one-tenth of 1 per cent.
[5] Number committed per 100,000 white population born in the same country.

The above table includes the ratio of commitments for each offense, thus permitting a comparison between the different nationalities as regards the relative frequency with which in proportion to their numbers in the total population they are committed for any given offense. It shows, for instance, that the ratio of commitments for assault ranged from 11.2 per 100,000 among the natives of Switzerland to 109.6 per 100,000 among the natives of Mexico, and the ratio of commitments for vagrancy from 23.4 per 100,000 among the natives of Hungary to 211.6 per 100,000 among the natives of Ireland. In the case of grave homicide the ratio of commitments per 100,000 was 5 for Mexico, 2.3 for Italy, and 1.6 for Switzerland. It should be noted, however, that in general, where an offense is normally of such infrequent occurrence that one or two cases occurring in a comparatively small class of the population give an abnormally large ratio, the ratio in that instance is of doubtful significance. That is the case as regards the comparatively high ratio of commitments for homicide among the Swiss, for it represents only two homicides occurring within the year. In all likelihood there may have been none the next year; and it would be necessary to collect data covering a series of years in order to obtain a significant rate for so small a population group. In general, however, the numbers involved are large enough to make the ratios significant and lend interest to the rank of the several countries in the ratio of commitments for each offense as shown in Table 142 (p. 132). On account of the small numbers committed for each class of homicides the rank is shown for the two classes in combination.

Table 143, on the following page, divides the offenders into two main classes, comprising those committed for drunkenness and disorderly conduct and those committed for other offenses. The caption "Drunkenness and disorderly conduct," it may be noted, covers all those cases in which the prisoner was convicted of either one of these offenses or of both of them in combination. When the charge was disorderly conduct without mention of drunkenness the prisoner may nevertheless have been intoxicated, but one can not be certain that that was the case. Figures presented elsewhere (see p. 30) show that for about one-third of the offenders committed for these offenses the charge was disorderly conduct without mention of drunkenness; but it is not possible to segregate these two offenses in the classification of offenders by race or nationality, as the data were not tabulated in sufficient detail.

[1] Number committed per 100,000 white population born in the same country.
[2] In computing this ratio persons reporting their mother tongue as Polish were excluded from the total population born in the specified country.
[3] See p. 128 for explanation regarding Poland as a country of birth.
[4] Includes cases where country of birth was not reported.

The above table gives the rank of the several nationalities according to the ratio of commitments for drunkenness and disorderly conduct and for all other offenses, respectively. In the case of some of the nationalities there is a striking difference in rank as determined by these two criteria. The Swedes, who ranked fourth as regards the ratio of commitments for drunkenness and disorderly conduct, ranked fourteenth as regards the ratio for other offenses; and the rank of the Norwegians according to these two ratios was, respectively, sixth and thirteenth. The Italians, on the other hand, who as regards drunkenness and disorderly conduct had the lowest ratio of commitments shown for any nationality, had the fourth highest ratio for other offenses.

SEX.

The total number of foreign-born white prisoners and juvenile delinquents committed in 1910 included 90,850 males and 8,789 females, the males outnumbering the females by more than 10 to 1. The proportion, however, varies considerably for different nationalities, as is indicated by the following table:

Table 144

COUNTRY OF BIRTH.	FOREIGN-BORN WHITE PRISONERS AND JUVENILE DELINQUENTS COMMITTED IN 1910.				Percentage of females in total population: 1910.
	Total.	Male.	Female.		
			Number.	Per cent of total.

Other countries [2]	5,017	4,834	183	3.6	29.8

[1] Data not available. See p. 133.
[2] Includes cases where country of birth was not reported.

The table shows wide variations in the percentage of females in the total population as well as among the prisoners and juvenile delinquents born in different countries. As would be expected, however, the percentage of females is invariably much smaller among the offenders committed to prisons and jails than it is in the general population, which means of course that in proportion to their numbers males are committed much more frequently than females in every nationality. The exact difference is shown by the next table, which gives the ratio of commitments for each sex, by nationality or country of birth.

Table 145

Other countries[2]	671.4	762.4	67.5

[1] Includes a proportionate number of the prisoners and juvenile delinquents reported as born in Poland corresponding to the proportion which the Polish population of the United States born in the specified country forms of the aggregate Polish population of the United States born in Austria, Germany, and Russia.
[2] Includes cases where country of birth was not reported.
[3] The ratio for each sex is the number committed per 100,000 total population of the same sex (white and colored) born in the same country.

It may be noticed that the list of countries, unlike that appearing in the previous tables of this section, does not distinguish Poland. This is because the Thirteenth Census population report does not show how many Poles there were of each sex in the total population of the United States in 1910 and accordingly no figures were available for "Poland" as a basis for computing ratios by sex. Following the next best method, the prisoners and juvenile delinquents of each sex reported as born in Poland have been distributed between Austria, Germany, and Russia on the basis of the proportion which the number of Poles born in each of these countries formed of the aggregate number born in all three countries. Furthermore, as the general population report does not give the classification by sex and country of birth for the foreign-born white population alone, but only for the total foreign-born population, white and colored, it was necessary to use the latter as a basis for computing the ratios which are shown in the above table. The number of nonwhite or colored persons born in any of the countries specified, however, is so inconsiderable that their inclusion would not affect the ratios appreciably if at all. Only for the residual group "Other countries," which includes Asiatic countries, is the difference great enough to affect the ratio materially, making it somewhat too small. It also has some appreciable effect on the total in the case of males, the difference being that between 1,207.5 (see Table 134) and 1,184.8.

As a comparatively small proportion of the prisoners and juvenile delinquents are females, the ratio of commitments is much higher for males alone than for both sexes combined. But although the elimination of females increases the ratio for some nationalities more than for others, it produces no very material change in the rank of the several nationalities. The ratio for males born in Ireland is, however, slightly higher than that for those born in Mexico, giving the former country the first rank and the latter the second, and thus reversing their relative position as compared with their rank upon the basis of the ratio for both sexes. Other differences or changes may be noted by reference to Table 147 (p. 134).

The highest ratio of commitments for females of foreign birth was that shown for the Irish (587.4 per 100,000), the Scotch ranking second in this respect and the English and Welsh together third, while the Mexicans ranked fourth.

The ratio of commitments for any class of the population, as already pointed out, depends in part upon the age composition of that class and particularly upon the proportion of young children or infants included in the total. While it is certain that the various foreign nationalities in the United States differ very considerably as regards age composition, it is not possible to determine the exact extent of these differences because in the reports of the population census the foreign-born population is not tabulated by age in combination with country of birth. It is, however, possible to show approximately what percentage of the male population born in any country in which the natives are practically all white were above or below 21 years of age, as the census returns give by country of birth the total number of males (white and colored) and also the number of white males 21 years of age or over.

The proportion of young children and infants among the natives of any foreign country depends partly on whether the immigration from the country in question is by families but more upon the recency of the immigration. The natives of a country from which immigration has been going on for a long time or is declining naturally include a larger proportion of persons over 21 years of age and a smaller proportion under that age than is the case when the immigration is of recent origin or is increasing. These probably are the main reasons why the proportion over 21 years of age is relatively large among the male natives of Germany and Ireland, and relatively small among those of Italy and Russia. As a result of this difference, the elimination of the male population

under 21 years of age increases the ratio of commitments very considerably for the two nationalities last named and but slightly for the first two named, as is indicated by a comparison of the last two columns in Table 146.

Table 146

COUNTRY OF BIRTH.	FOREIGN-BORN MALE POPULATION: 1910.			RATIO OF WHITE MALE PRISONERS COMMITTED IN 1910—

Russia	927,219	737,120	79.5	[2]794.7	[2]969.9
Scotland	144,659	133,116	92.0	1,943.9	2,107.9
Sweden	369,953	349,022	94.3	1,156.1	1,223.1
Switzerland	72,726	69,241	95.2	529.4	554.6

[1] This ratio includes white male juvenile delinquents as well as white male prisoners of all ages.
[2] Includes a proportionate number of prisoners and juvenile delinquents reporting Poland as country of birth. See p. 133.
[3] Includes Newfoundland.

The ratio in the last column of the above table, it should be observed, is not strictly the ratio of commitments among males 21 years of age or over, but is somewhat larger because it includes prisoners committed under 21 years of age, although it does not include juvenile delinquents. The tables prove that while the ratios for the several nationalities are affected in some degree by the proportion of children this factor does not materially change the rank or relative position of the several nationalities. This is shown also by Table 147 giving the rank of the several nationalities as determined by the ratio for both sexes, males, males 21 years of age or over, and females, respectively.

Table 147

COUNTRY OF BIRTH.	RANK WITH RESPECT TO THE RATIO OF COMMITMENTS FOR—			
	Both sexes.[1]	Males.[1]	Males 21 years of age or over.[2]	Females.[1]

[1] For ratio referred to, see Table 145.
[2] The ratio in this case is the number of white male prisoners of all ages committed per 100,000 white males 21 years of age or over. See Table 146.

Table 148 classifies the foreign-born white male prisoners and juvenile delinquents by offense, showing the number committed, the per cent distribution by offense, and the ratio of commitments for each offense. Table 149 is a similar presentation for females. Since the great majority of the prisoners are males the differences shown in a comparison of the different nationalities in the table for males alone are much the same as those brought out by the corresponding figures for both sexes combined. In the case of females the numbers committed for many of the specified offenses were not large enough to make the ratio of much significance, and accordingly the ratio is shown only for some of the principal offenses.

[1] Includes a proportionate number of prisoners and juvenile delinquents reporting Poland as country of birth. See p. 133.
[2] Includes cases where country of birth was not reported.
[3] Per cent not shown where base is less than 100.
[4] Less than one-tenth of 1 per cent.
[5] Number committed per 100,000 females (white and colored) born in the same country.

NATIVE AND FOREIGN PARENTAGE.

The schedule of questions adopted for the census of prisoners called for the country of birth of the parents of each prisoner committed as well as for that of the prisoner himself. On the basis of the answers to these questions, the white prisoners and juvenile delinquents who were natives of the United States were distributed into two main classes, comprising, respectively, those both of whose parents were also natives of the United States and those one or both of whose parents were foreign born, the former being designated as the native white of native parentage and the latter as the native white of foreign or mixed parentage. Since, however, the question as to birthplace of parents remained unanswered in many cases, it is necessary to distinguish a third class, the native white of unknown or unreported parentage.

Of the 253,929 prisoners and juvenile delinquents committed during the year 1910, 56.1 per cent, or more than one-half, were reported as of native parentage and 28.7 per cent, or more than one-fourth, as of foreign or mixed parentage, while for 15.2 per cent no return as to parentage was secured. The size of the unknown parentage class impairs to some degree any comparison with the parentage classification of the total population; but the percentages of native and of foreign or mixed parentage in the total number of native white prisoners whose parentage was reported are presumably comparable with the corresponding percentages of the total native white population. Both percentages are shown in the following table:

Table 150

PARENTAGE.	NATIVE WHITE PRISONERS AND JUVENILE DELINQUENTS COMMITTED IN 1910.				Per cent distribution of total native white population: 1910.
	Number.	Per cent distribution.		Ratio per 100,000 population of same parentage.	
		Total.	Excluding those of unreported parentage.		
Total	253,929	100.0	.....	371.3	100.0
Parentage reported	215,244	84.8	100.0	.....	.....
Native parentage	142,489	56.1	66.2	287.9	72.4
Foreign or mixed parentage	72,755	28.7	33.8	385.0	27.6
Parentage not reported	38,685	15.2	.....	.....	.....

While 27.6 per cent, or rather more than one-fourth, of the total native white population in 1910 were of foreign or mixed parentage, the proportion in the case of the prisoners and juvenile delinquents committed in 1910 whose parentage was reported was about one-third, or 33.8 per cent. The ratio of commitments, or number committed per 100,000 population of the same parentage class, was 385 for the native white of foreign or mixed parentage, as compared with 287.9 for the native white of native parentage, the former ratio thus being about one-third larger than the latter.

The classification by parentage within each geographic division is shown by the following table:

Table 151

DIVISION.	NATIVE WHITE PRISONERS AND JUVENILE DELINQUENTS COMMITTED IN 1910.						
	Number.				Per cent of total.		
	Total.	Native parentage.	Foreign or mixed parentage.	Parentage not reported.	Native parentage.	Foreign or mixed parentage.	Parentage not reported.
United States	253,929	142,489	72,755	38,685	56.1	28.7	15.2
New England	29,407	9,636	18,975	796	32.8	64.5	2.7
Middle Atlantic	68,546	34,072	25,211	9,263	49.7	36.8	13.5
East North Central	55,861	33,896	14,763	7,202	60.7	26.4	12.9
West North Central	28,852	16,271	4,851	7,730	56.4	16.8	26.8
South Atlantic	20,309	16,226	2,619	1,464	79.9	12.9	7.2
East South Central	11,875	10,166	486	1,223	85.6	4.1	10.3
West South Central	8,861	6,047	621	2,193	68.2	7.0	24.7
Mountain	11,358	6,577	2,034	2,747	57.9	17.9	24.2
Pacific	18,304	9,198	3,059	6,047	50.3	16.7	33.0
United States penitentiaries	556	400	136	20	71.9	24.5	3.6

The proportion whose parentage was not reported varied widely in the several divisions. In New England it was relatively small, being only 2.7 per cent, but in the Pacific division reports as to parentage were lacking for about one-third of the total number of prisoners and juvenile delinquents committed, and in the West North Central, West South Central, and Mountain divisions for about one-fourth. Obviously these variations in the percentage whose parentage was not reported impair the significance of comparisons between the different divisions in respect to the reported percentages of native or of foreign or mixed parentage. Table 152, however, shows the percentage of foreign or mixed parentage in the total number of native white prisoners and juvenile delinquents whose parentage was reported. These percentages are of course correct if it can be assumed that the proportion of foreign or mixed parentage was the same among those prisoners whose parentage was not reported as it was among those for whom it was reported. The table shows for comparison the percentage of foreign or mixed parentage in the general native white population of the several divisions. In New England and in the South Atlantic division the percentage of foreign or mixed parentage is much larger among the prisoners and juvenile delinquents whose parentage was reported than it is in the general population. In the other divisions the difference is not so great, the percentage being, however, larger in the general popu-

lation than among the prisoners in all these divisions except the Middle Atlantic and East South Central.

Table 152

DIVISION.	PERCENTAGE OF FOREIGN OR MIXED PARENTAGE.			RATIO OF COMMITMENTS.[1]		
	Among native white prisoners and juvenile delinquents committed in 1910.		In total native white population: 1910.	Native white of native parentage.	Native white of foreign or mixed parentage.	Coefficient of difference.
	Total.	Excluding those of unreported parentage.		A	B	B÷A
United States	28.7	33.8	27.6	287.9	385.0	1.3
New England	64.5	66.3	44.0	368.7	924.4	2.5
Middle Atlantic	36.8	42.5	39.8	402.6	450.9	1.1

West North Central	16.8	23.0	33.0	249.4	150.9	0.6
South Atlantic	12.9	13.9	5.7	221.0	595.4	2.7
East South Central	4.1	4.6	3.8	186.4	226.1	1.2
West South Central	7.0	9.3	9.5	104.8	102.6	1.0
Mountain	17.9	23.6	29.6	448.4	329.7	0.7
Pacific	16.7	25.0	33.3	436.2	290.3	0.7

[1] Number of prisoners and juvenile delinquents committed in 1910 per 100,000 population of the same race, nativity, and parentage.

Table 152 gives also the ratio of commitments, by divisions, for each parentage class, with the coefficient of difference. These ratios, it may be noted, are based on the numbers whose parentage was reported. In those divisions in which the percentage whose parentage was not reported was large the ratios are of course considerably smaller than the true ratios. But an apportionment of the "parentage not reported" class on the basis of the proportions shown among those whose parentage was reported, although it would alter the relationship between the different divisions, would not affect the coefficient or the comparison of one ratio with the other within the same division. In New England, where the parentage returns were nearly complete, the ratio of commitments for the foreign or mixed parentage class is about two and one-half times as great as that for those of native parentage. The contrast is equally striking in the South Atlantic division, but in the other divisions the difference is not as great and in four divisions, namely, the two North Central, the Mountain, and the Pacific, the higher ratio is that for persons of native parentage.

The classification of the native white prisoners and juvenile delinquents by parentage and age is shown in Table 153, while Table 154 shows by age groups the percentage of foreign or mixed parentage among those whose parentage was reported and also in the total native white population, together with the ratio of commitments for each parentage class and the coefficient of difference. In the groups from 15 to 34 years of age, inclusive, the ratios for the two classes do not differ widely, but above the age of 35 the ratio for the native white of foreign or mixed parentage is considerably larger than that for the native white of native parentage and this difference becomes still more marked above the age of 55.

65 years or over	25.8	29.6	10.4	99.1	358.0	3.6
Age not reported	3.2	5.9	9.7	.....	.....	.....

[1] Number of prisoners and juvenile delinquents committed in 1910 per 100,000 population of the same race, nativity, parentage, and age.

It is not altogether obvious why the difference between the ratios for the two classes should be so much greater in early youth and at the more advanced ages than in middle life. But it will be remembered that a similar though rather less marked difference was revealed in the comparison by age groups between the native white and foreign-born white (see pp. 119 and 125), and some of the considerations suggested as possible explanations of that difference may apply here. Moreover, the native white of foreign or mixed parentage, as well as the foreign-born white, are concentrated in cities to a much greater extent than the native white of native parentage and it is probable that in the cities there are more commitments relatively for juvenile offenses and also more for drunkenness, which was shown by the offense and age classification to be more common in the older age groups than in the younger. In other words, the difference between the foreign and native elements of the population as regards the ratio of commitments in the successive age groups may be attributable in part to the difference between an urban and a rural environment.

MARITAL CONDITION.

In General Table 102 the prisoners committed to penal or reformatory institutions in 1910 are classified by length of sentence, sex, and marital condition for the United States as a whole and for the several geographic divisions. Juvenile delinquents are not included in this classification, the question as to marital condition not having been inserted on the schedules for this class of youthful offenders, practically all of whom are presumably single. Table 155 gives the classification of prisoners by sex and marital condition for the United States as a whole, together with the ratio of prisoners in each marital class per 100,000 adult population of the same marital condition, and the per cent distribution by marital condition of prisoners and of the total population 15 years of age or over.

Table 155 — MARITAL CONDITION.	PRISONERS COMMITTED IN 1910. Number.	Per cent distribution.[1]	Ratio per 100,000 population 15 years of age or over.	Per cent distribution of total population 15 years of age or over: 1910.[1]
	MALE.			
Total	433,460	100.0	1,336.8	100.0
Single	251,109	68.6	2,000.8	38.9
Married	96,203	26.3	531.7	56.1
Widowed	15,262	4.2	1,037.3	4.6
Divorced	3,716	1.0	2,379.6	0.5
Marital condition not reported	67,170	.....	.....	.....
	FEMALE.			
Total	46,327	100.0	154.2	100.0
Single	17,813	44.0	199.4	29.8
Married	17,367	42.9	98.2	59.0
Widowed	4,654	11.5	146.5	10.6
Divorced	669	1.7	361.5	0.6
Marital condition not reported	5,824	.....	.....	.....

[1] Based upon the population whose marital condition was reported.

In this table the prisoners of all ages are compared with the general population 15 years of age or over instead of the aggregate general population, because only 0.3 per cent of the prisoners committed in 1910 were under 15 years of age. It is probable that nearly all of the 1,281 prisoners committed under 15 years of age were single and also that most of them were males. Of the females under 15 years of age sent to institutions a larger proportion were sent to institutions for juvenile delinquents than in the case of males.

There were 2,000.8 commitments in 1910 of single males for every 100,000 single males in the total adult population. This ratio is higher than that for any other marital class except divorced males. As regards the high ratio for divorced males (2,380) it should be mentioned that the number of divorced persons as reported in the general population census is believed to be deficient. It is not improbable that the number of prisoners reported as divorced may have been more accurate, in which case the reported ratio of prisoners to total population in this marital class would of course be larger than the true ratio. At the same time it seems not unlikely that the divorced as a class of the population may include a relatively larger representation of the criminal or lawless elements in society than any of the other marital classes and would therefore show a larger ratio of commitments. The number of commitments of married males per 100,000 married males in the total adult population (531.7) is very low as compared with the other ratios for males, being hardly more than one-fourth as great as that for single males and about one-half as great as that for the widowed.

In the general population there are very marked differences in the age composition of the different marital classes. The single consist largely of young persons, the widowed of old persons, and the married of those in middle life. Thus 62.8 per cent of the single adult males in 1910 were under 25 years of age, while of the married only 6.4 per cent were below that age, 74.6 per cent being between the ages of 25 and 54. The question naturally arises as to whether the differences between these two marital classes as regards the ratio of commitments to prisons and jails may not be largely the result of the age difference here noted. The question could be definitely determined by making the comparison by age groups, so as to show whether the difference is as marked within the several age groups as for the totals. It is not possible to do this, however, because the marital condition returns for prisoners were not tabulated in combination with age. It is possible, nevertheless, to obtain some light upon this question by assuming that the ratios for the married and the single within each age group are identical with the ratio for the total male population in that age group as shown in Table 70 (p. 85), and then determining whether on that assumption the mere difference in the age composition of the two classes—the married and the single—would result in any material difference in the ratios for the totals of each class. This can be done by multiplying separately the married and the single male population in each age group above the age of 15 by the ascertained ratio of commitments for the total male population in the same age group, adding the several

products for each marital class, and dividing the total in each case by the total male population 15 years of age or over in the same marital class. The resulting ratios, 1,245.5 for the married and 1,178.4 for the single, are so nearly alike as to indicate that the age distribution is not much of an influence in determining the difference between the married and the single as regards the ratio of commitments. The difference that does exist indicates that if age were the only factor there would be more married men, relatively, than single ones committed, whereas actually the ratio of commitments for single men was about four times as great as that for married men. In other words, the computation creates at least a strong presumption that within the several age groups the ratios are higher for the single than the married, just as they are in the totals. It should be remembered in this connection that three leading offenses—drunkenness, disorderly conduct, and vagrancy—account for nearly two-thirds of the total number of commitments, and it seems not improbable that the more regular and responsible lives of the married may result in making them as a class less likely to commit such offenses as these, whatever the case may be as regards the graver crimes and offenses.

The number of female prisoners committed in 1910 per 100,000 total adult female population (154.2) is less than one-eighth the corresponding ratio for male prisoners committed. The ratios of commitments for the different marital classes rank in the same order for females as for males, but the contrast between the ratios for the divorced and the single is relatively greater and that between the ratios for the single and the married is less than in the case of the male prisoners committed.

Of the male prisoners committed, 68.6 per cent were single, and only 26.3 per cent were married, while the percentages for females were, respectively, 44 and 42.9.

The distribution according to marital condition of the male and female prisoners committed in 1910 is shown in Table 156 for the United States as a whole and by geographic divisions, together with the number per 100,000 population 15 years of age or over of the same marital condition.

[1] Based upon the population whose marital condition was reported.
[2] Includes figures for United States penitentiaries, which are not shown separately in this table.

For the male prisoners the divorced show the highest ratio in the majority of the divisions, followed in turn by the single, widowed, and married. In the New England, Middle Atlantic, and East South Central divisions, however, the single show the highest ratio, and in the East South Central division the ratio is higher for the married than for the widowed. For the females the ratios, which are much smaller in every case, show no such uniformity, although they are higher for the divorced than for any other class in all but the Middle Atlantic, South Atlantic, and East South Central divisions, where the divorced rank second in this respect. In contrasting the differences with regard to the distribution of prisoners according to marital condition in the different divisions, it should be borne in mind (see p. 30) that a very large part of the commitments were for minor offenses, and that the total number of commitments is determined to a great ex-

tent by the state laws and local ordinances and by the practice of the courts and police in defining and punishing such offenses. As will be shown later, there is a larger proportion of single than of married among persons sentenced for minor offenses.

In most of the geographic divisions not far from two-thirds of the male prisoners committed were single, but in the West North Central and Mountain divisions the proportion single was about three-fourths, or 73.2 and 74.3 per cent, respectively, and in the Pacific division the proportion was over four-fifths, or 81 per cent. The percentage single among female prisoners ranged from 23.9 in New England to 67.6 in the East South Central division, a much wider range of variation than is shown for male prisoners. In New England 55.4 per cent, or more than one-half, of the female prisoners committed were married women, and in the Middle Atlantic and the East North Central divisions the proportion was only a little less than one-half, but in other divisions it was smaller, varying from 27.6 per cent in the East South Central division to 46.5 per cent in the West North Central.

Table 157 gives the distribution by sentence of the male and female prisoners committed in 1910 classified according to marital condition, and shows also the per cent in each marital class for each form of sentence.

[1] Based upon the population whose marital condition was reported.
[2] Based upon the population for whom the nature of sentence was reported.
[3] Less than one-tenth of 1 per cent.
[4] Per cent not shown where base is less than 100.

The most striking feature about the marital condition of the male prisoners, as classified by nature of sentence, is the fact that the percentage single varies inversely with the severity of the sentence. The more severe the sentence, and hence, in all probability, the more serious the offense for which the sentence was imposed, the smaller is the proportion of single men among those receiving it. Only in the case of prisoners sentenced to death was there an exception to this rule, the percentage single in this case (59.5) being larger than it was among those sentenced to imprisonment for life or for a definite term of five years or over. Of the male prisoners committed for a term of less than one year, 68.9 per cent were single; among those committed for a term of from one to four years the percentage was 59.7; among those committed for five years or over it was 55.8; and among those committed for life it was only 46. The variation is all the more significant because of the fact that in the total population the single are concentrated principally in the younger age groups, and, as has already been pointed out (see p. 77), there is an almost uninterrupted decrease in the average length of sentence with each advance in age. It would seem, therefore, that the married, although they are as a class less likely to be committed to prison or jail than the single, receive more severe sentences on the average than do the single, thus indicating that a larger proportion of the mar-

ried prisoners than of the single were convicted of serious offenses, or conversely, that minor misdemeanors were more common among the single prisoners than among the married.

The percentage widowed is usually too small to excite comment, but among the males sentenced to death and among those sentenced to life imprisonment it is so high, comparatively (11.9 and 7.2, respectively), as to suggest that a large proportion of the homicides which resulted in these sentences were uxoricides or, in other words, that the men who committed these crimes were married men who became widowers by their own act.

The same tendency to a higher percentage of married and a smaller percentage of single persons among those receiving the more severe sentences as compared with those receiving the lighter sentences noted in the case of the male prisoners committed is evident in the case of female prisoners. The variation is not quite so consistent, however; thus among those committed for five years or over 40.4 per cent, among those committed for from one to four years, 43.6 per cent, and among those imprisoned for nonpayment of fine, 47.2 per cent were single, but of those committed for less than one year only 39.1 per cent were single.

Especial interest attaches to the sentence imposed on the married male prisoners because in most cases the commitment of a husband deprives a family of its breadwinner, and the length of time such deprivation must be suffered depends of course on the sentence received. There were 96,203 married men committed to penal or reformatory institutions in 1910, and for 95,968 of them the nature of the sentence was reported. Of these, 43,568, or 45.4 per cent, were sentenced to imprisonment only or to imprisonment and fine, and 52,364, or 54.6 per cent, were committed for nonpayment of fine; the corresponding percentages for the total number of males committed were 41.9 and 58.1, respectively. Of the married men 319, or 0.3 per cent, were committed for life; 1,607, or 1.7 per cent, for five years or over; 5,592, or 5.8 per cent, for from one to four years; 32,591, or 34 per cent, for less than one year; and 3,293, or 3.4 per cent, for an indeterminate period. The corresponding percentages for the total number of males were 0.2 committed for life, 1 for five years or over, 3.7 for from one to four years, 33.6 for less than one year, and 3.2 for an indeterminate period. The percentage for married men was higher than that for the total number of males for each kind of sentence except for commitments for nonpayment of fine. The fact that a smaller percentage of married men than of the total number of males were committed for nonpayment of fine lends support to the inference that married men are less likely to commit such offenses as drunkenness and disorderly conduct, which are offenses commonly punished by fines, than are single men.

The relative extent to which males in the different marital classes were sentenced to imprisonment for less than six months is shown by geographic divisions in Table 158.

Prisoners sentenced for their minority or for an indeterminate period, together with those committed for nonpayment of fine and those the nature or length of whose sentence was not reported, have been excluded from the total in this table. The percentage of the total sentenced to imprisonment for a term of less than six months was smaller for the married than for the single in every geographic division. This confirms the conclusion that there is a larger proportion of minor offenders among the single prisoners than among the married.

In the case of the widowed and divorced the percentage sentenced to terms of less than six months is usually intermediate between the percentage for the single and that for the married, the single showing as a rule the highest percentage for any marital class and the married the lowest.

LITERACY.

It is to a considerable extent regarded as a truism that ignorance is one of the most important sources of crime; and in the sense that the ignorant classes of a community will ordinarily produce more criminals relatively than the educated classes this is probably correct, although it must be borne in mind that for the commission of certain crimes some degree of education is essential. The reason for this connection between crime and ignorance lies of course mainly in the fact that the latter is apt to be accompanied by a lack of moral training; furthermore, the ignorant are usually the least fortunately situated economically, and hence perhaps especially likely to be led to commit unlawful acts for economic reasons, while at the same time they are less likely to know what is permitted and what is forbidden than those who have received some education.

It is difficult, however, to bring out statistically the precise relation between crime and ignorance, owing to the fact that there is no criterion of ignorance which is at once accurate and easily applied. The mere fact of attendance at school is no test, as the schooling may have been so rudimentary in its nature or so brief that it could hardly be claimed to presume any significant degree of mental or moral enlightenment on the part of the person who has received it. The only scientific method of securing information on this subject of course is to obtain detailed data as to the education of criminals, and make an intensive study of the results. This method was impracticable in connection with the present investigation for the reason that the manner in which the returns were secured rendered it necessary to make all the inquiries as simple and as easy to answer as possible. An inquiry as to the literacy of the prisoner was, however, inserted on the schedule for commitments, the person filling it out being asked to indicate whether the prisoner was able, respectively, to read and to write. Inasmuch as the ability to read or write may have been very rudimentary in character, it is as an index of general intelligence subject in even greater degree to the limitation above pointed out as existing in the mere fact of school attendance; at the same time in the absence of a more accurate criterion statistics on this point serve, especially when compared with similar statistics for the general population, to throw some light upon the question as to how far ignorance is associated with crime or lawbreaking.

Although, as stated above, the schedule asked for information as to the prisoner's ability both to read and to write, it was decided in tabulating the statistics to confine the presentation to the returns as to ability to write, which conforms with the practice adopted in the general population report. It should be kept in mind, therefore, in connection with the statistics here presented that the persons tabulated as illiterate represent only those who reported that they were unable to write, regardless of their ability to read. The statistics are confined to prisoners committed, no inquiry as to literacy having been included in the schedule for the prison population on January 1, 1910.

In tabulating the returns as to literacy no classification was made according to age. For this reason in most of the tables in this section the statistics relate to prisoners only, since the percentage of illiteracy as a rule increases with age, and it was believed that the statistics would be more significant if they were confined as far as possible to adult offenders. There were, it is true, a certain number of juvenile offenders among the prisoners committed, but they represent so small a proportion of the total that the figures are not materially affected. Separate figures for offenders committed to juvenile reformatories, who, as previously explained, are in this report designated as "juvenile delinquents," are presented in the section on juvenile offenders (see p. 196).

Table 159 summarizes the returns as to literacy for prisoners and juvenile delinquents combined and for each class separately.

Table 159 — PRISONERS AND JUVENILE DELINQUENTS COMMITTED IN 1910.

General Table 103 (p. 484) shows, by geographic divisions and states, the number of prisoners and of juvenile delinquents committed in 1910, classified according to literacy and sex. Table 160 summarizes the statistics on this subject for prisoners for the United States as a whole.

Table 160 — PRISONERS COMMITTED IN 1910.

Not reporting as to literacy	49,379	44,956	4,423	.....	.....	.....

Of the 479,787 prisoners committed in 1910, 375,142, or 78.2 per cent, were reported as literate and 55,266, or 11.5 per cent, as illiterate, while for 49,379, or 10.3 per cent, the inquiry as to literacy was not answered. In view of the large number for whom no returns were secured, and the considerable variation in the proportion which these formed of the total in the different parts of the country, the percentage of illiterate persons among those for whom reports were secured forms a more accurate index of the relative degree of illiteracy than a percentage illiterate based upon the total number of prisoners committed. Employing the former basis, the proportion illiterate among the prisoners committed in 1910 was 12.8 per cent, or more than one-eighth, as compared with a proportion illiterate in the general population 15 years of age or over in 1910 of 8.2 per cent, or about one-twelfth. In other words, illiterate persons were about one and one-half times as numerous relatively among those sentenced for commission of crimes or misdemeanors as in the general population, a fact which tends to confirm what has already been said as to the relation between crime and ignorance. The contrast may perhaps be brought out even more clearly by a comparison of the number of literate and illiterate prisoners, respectively, and the number in the corresponding classes of the general population. The ratio of illiterate prisoners committed to the total illiterate population 15 years of age or over was 1,074 per 100,000, whereas the corresponding ratio for literate prisoners was only 654.3 per 100,000; the former ratio was one and six-tenths times the latter, or in other words, the contribution of the illiterate population to the prison commitments was in proportion to its numbers about one and three-fifths times as great as that of the literate population. It must be remembered in this connection, moreover, that in general the percentage of illiteracy is higher among old people than among young people, and that old people are much more numerous relatively in the adult general population than among prisoners committed, so that if it were possible to present a comparison by individual age groups the showing for prisoners would be even less favorable. As a matter of fact, if the percentage illiterate had been the same in each age group among the prisoners committed as in the corresponding age group of the general population the percentage illiterate in the total number of prisoners would have been only 7.8, instead of 12.8. In other words, so far as the difference in age composition affects the figures the percentage of illiteracy ought to be lower among prisoners than in the general population, whereas it is in fact considerably higher.

The proportion illiterate is somewhat higher for female prisoners than for male; of the females for whom returns as to literacy were received, 16.5 per cent, or about one-sixth, were illiterate, as compared with 12.4 per cent, or one-eighth, of the males, although the percentage illiterate for the two sexes in the general population is practically the same (7.8 and 7.6, respectively), and although the proportion at the later ages, which show the highest percentage of illiteracy, is greater among the male prisoners 15 years of age or over committed than among the female, 18.5 per cent of the former being 45 years of age or over, as compared with 11.7 per cent of the latter.

Table 161, on the following page, classifies the prisoners committed in each division and state according to their literacy, and shows for comparison the percentage illiterate in the general population 15 years of age or over.

As would be expected, the rank of the several divisions in respect to the percentage of illiterates among the sentenced prisoners reported corresponds in a general way to their rank in the percentage illiterate in the general population. The proportion illiterate among sentenced prisoners was highest (25.1 per cent, or about one-fourth) in the East South Central division, followed by the South Atlantic with 22 per cent, or somewhat more than one-fifth, while it was slightly in excess of one-fifth in the West South Central and Mountain divisions also, these four divisions likewise leading in the percentage illiterate in the general population. The Middle Atlantic and New England divisions follow in both cases, although the order differs, a fact which is without significance in view of the slight differences in the percentages for the two divisions. The order of the three remaining divisions also differs, the East North Central division showing the lowest percentage of illiteracy for prisoners (7.3), while the percentage illiterate in the general population is higher in this division than in the West North Central and Pacific divisions; in this case also the differences in the percentages are so small that the variation in order is unimportant. It will be observed that in every division the percentage illiterate among the prisoners committed is substantially higher than that in the general population. The difference, however, varies in extent, being least relatively in the South Atlantic division and greatest in the Mountain division, in which one-fifth (20.6 per cent) of the prisoners committed were illiterate, as compared with a corresponding percentage of only 7.3 in the general population. The especially striking contrast for the latter division results from the very high percentage of illiteracy among the foreign-born white prisoners in this division (comprising in this case probably a large proportion of Mexicans) and among the Indian prisoners, as these classes of the population contributed a relatively large number of prisoners in proportion to their representation in the total population.

The order of the several states in regard to the percentage illiterate among the prisoners committed, though corresponding in a general way to their order in the percentage illiterate in the general population, shows some variation, due probably to differences in local conditions. The percentage illiterate among prisoners was highest (42.1) in Arizona, which ranked seventh in regard to the percentage illiterate in the general population, and lowest (3.1) in Oregon, which also shows the lowest percentage illiterate in the general population.

General Table 104 (p. 485) shows, by geographic divisions and states, the distribution according to race and nativity and literacy of the sentenced prisoners committed in 1910. Table 162 summarizes the statistics for the United States as a whole.

Table 162

RACE AND NATIVITY.	PRISONERS COMMITTED IN 1910.						Per cent illiterate in total population 15 years of age or over: 1910.
	Total.	Reporting as to literacy.				Not reporting as to literacy.	
		Total.	Literate.	Illiterate.			
				Number.	Per cent of total reporting.		
All classes	479,787	430,408	375,142	55,266	12.8	49,379	8.2
White	370,019	336,763	305,594	31,169	9.3	33,256	5.4
Native	243,053	232,856	222,388	10,468	4.5	10,197	3.2
Foreign born	98,536	94,880	75,193	19,687	20.7	3,656	13.0
Nativity not reported	28,430	9,027	8,013	1,014	11.2	19,403	.....
Negro	106,170	90,375	67,732	22,643	25.1	15,795	32.6
Other colored	3,598	3,270	1,816	1,454	44.5	328	32.8

The order of the several race and nativity classes in respect to the percentage illiterate among the prisoners committed is the same as their order in respect to the percentage illiterate in the general population. In the case of the native and foreign-born whites and the "other colored" the percentage for prisoners exceeds that for the general population; the Negroes, however, are an exception in this respect, only 25.1 per cent of the Negro prisoners for whom a report was secured being illiterate, as compared with a percentage illiterate of 32.6 for the general Negro population. The difference between the percentages is greatest relatively for the foreign-born whites, one-fifth (20.7 per cent) of the foreign-born white prisoners for whom returns as to literacy were secured being illiterate, as compared with only about one-eighth (13 per cent) of all foreign-born whites 15 years of age or over.

The exception to the rule that the percentage illiterate is higher among prisoners than in the general population, which was above pointed out as existing in the case of Negroes, is due mainly to the circumstance that the difference between the younger and older age groups among the Negroes as regards the percentage illiterate is much greater than it is among the whites (see Table 163). The precise influence of this factor may be determined by ascertaining what the percentage illiterate in the total number of Negroes committed would be if the percentage illiterate in each age group was the same as in the corresponding age group of the total Negro population. In making this computation it is necessary to use as a base the combined figures for prisoners and juvenile delinquents 15 years of age or over, as separate figures for prisoners 15 years of age or over are not available; the difference, however, is not great enough to affect the comparison. The percentage thus obtained is 27.3 for the Negro prisoners, as compared with a corresponding percentage of 32.6 for the Negro population. In other words, if the percentage of illiteracy among Negro prisoners at each age was the same as that among the Negro population of the same age, the percentage of illiteracy in the total number of Negro prisoners would, nevertheless, be much lower than that for the Negro population, simply because the relatively high percentage of illiteracy among old people has less influence upon the percentage for the prisoners than upon that for the Negro population. This makes it evident that the difference in age composition between Negro prisoners and the Negro population, taken in connection with the fact that the illiteracy of the older age groups in the Negro population is much greater than that of the younger, goes far towards explaining why there is less illiteracy among Negro prisoners as a class than in the Negro population. At the same time it is evident that this is not a complete explanation, as the percentage obtained by the above computation (27.3) is still not as low as the actual percentage (25.1), indicating that other factors also enter in, one of which is suggested in the discussion of the figures presented in Table 164 (see p. 149).

Table 163

AGE.	PER CENT ILLITERATE: 1910.	
	In white population.	In Negro population.
10 years or over	5.0	30.4
10 to 14 years	1.8	18.9
15 to 19 years	2.8	20.3
20 to 24 years	4.6	23.9
25 to 34 years	5.2	24.6
35 to 44 years	5.4	32.3
45 to 54 years	6.3	47.0
55 to 64 years	7.4	63.0
65 years or over	9.4	74.5

General Table 105 (p. 486) shows, by geographic divisions and states, the distribution according to race, nativity, and literacy of the prisoners committed to penal or reformatory institutions in 1910 under sentence of death or imprisonment, and General Table 106 (p. 487) shows a similar distribution of the prisoners committed for nonpayment of fine. Table 164 (p. 148) shows for each division the percentage illiterate among all sentenced prisoners committed in 1910 and among the two main classes with respect to nature of sentence, distributed according to race and nativity.

[1] Includes those for whom the nature of sentence was not reported.

When the various race and nativity classes are taken together, the percentage illiterate is practically the same for prisoners committed under sentence of death or imprisonment and those committed for nonpayment of fine, being 12.8 in the former instance and 12.9 in the latter. The percentages for the two groups also show only a slight difference in the case of the native whites; but for the classes included under the head of "Other colored" the percentage is much higher, and for the foreign-born whites it is slightly higher, in the case of those committed for nonpayment of fine, while for the Negroes it is higher in the case of those committed under sentence of death or imprisonment.

A study of the figures as to the percentage illiterate for these two main classes of prisoners with respect to nature of sentence in the different divisions throws additional light on the reason why the Negroes, as already noted, form an exception to the general rule that the percentage illiterate is higher among prisoners than in the general population. Of the individual divisions, five conform to the general rule just mentioned in the case of Negroes as well as of whites. The remaining divisions, however, comprise, in addition to the West North Central division, the three southern divisions, which furnished considerably more than two-thirds (71.6 per cent) of the Negro prisoners reported. In two out of the three southern divisions (the East and West South Central) the percentage illiterate is higher among Negro prisoners committed under sentence of death or imprisonment than in the general population, while in the South Atlantic division the percentages are practically identical, the lower percentage illiterate shown in these divisions for all Negro prisoners without regard to the nature of their sentence, as compared with the general population, being due to the fact that the Negro prisoners committed for nonpayment of fine, who constitute two-thirds or more of the total in these three divisions, show a substantially lower percentage of illiteracy than do those committed under sentence of death or imprisonment. This lower percentage of illiteracy for the prisoners committed for nonpayment of fine, which is shown for the native whites as well as the Negroes in the South, is probably accounted for in large measure by the circumstance that the offenses punished solely by fine are mainly offenses such as drunkenness, disorderly conduct, or violation of city ordinances, which occur wholly or largely in cities, where the percentage of illiteracy is generally much lower than in rural districts.

OCCUPATIONS.

The occupation prior to commitment was reported for 374,988, or 84.2 per cent, of the 445,368 male prisoners and juvenile delinquents committed in 1910. Table 165 shows the per cent distribution by occupation of the male prisoners and juvenile delinquents committed during 1910 for each of the principal offenses, occupations reported by less than 500 of their number being grouped as "All other occupations." The numbers from which these percentages were derived are given in General Table 108 (p. 489).

[1] Less than one-tenth of 1 per cent.

Of the total number of male prisoners and juvenile delinquents committed during 1910, 33.6 per cent reported that they had been general laborers—shown in the table as "Laborers (not otherwise specified)"—3.3 per cent that they had been farmers, 3.2 per cent that they had been teamsters, and 2.9 per cent that they had been farm laborers. These are the four leading occupations and account for over two-fifths of the total, or over one-half of the total number of males reporting an occupation.

That farmers and farm laborers, who comprised, respectively, 18.6 and 14.8 per cent of the total male population 10 years of age or over in 1910, do not form a larger proportion of the males committed in 1910 is probably due to the fact that persons in rural communities are not so likely to be committed to penal or reformatory institutions for minor offenses as those in cities. By reference to the figures for the various offenses for which the male prisoners were committed it will be seen that in general the more serious the offense the greater is the proportion of farmers and farm laborers among the total number of males committed for it. Of the male prisoners and juvenile delinquents committed in 1910 for grave homicide, 18.6 per cent were farmers and 16.6 per cent were farm laborers, and of those committed for lesser homicide 19.8 per cent were farmers and 13.3 per cent were farm laborers; but of those committed for drunkenness and disorderly conduct, offenses which were the cause of over one-half of all the commitments, only 2.6 per cent were farmers and 2.5 per cent farm laborers.

General laborers and teamsters, on the other hand, were much more numerous relatively in the total number of commitments than in the total population. In the case of general laborers this may be attributed in part to a tendency for the prison returns to be less definite as to the occupation prior to commitment than were the reports as to occupation of the population census, as a result of which difference laborers who would be assigned to some other classification if specific returns had been received were included as "laborers (not otherwise specified)" in the instance of prisoners and juvenile delinquents to a greater extent than in that of the total population. It is possible, however, that the predominance of general laborers and of teamsters among the males committed in 1910 is due partially to an actually greater liability of persons engaged in these occupations as compared with people in other pursuits to commit offenses which are punished by imprisonment in penal or reformatory institutions.

The occupational group comprising the largest number of male prisoners and juvenile delinquents committed is in the case of each offense shown, except "offenses peculiar to children," that made up of general laborers, as would be expected in view of the very large proportion they form of the total number committed. They comprised 39.9 per cent of the males committed for fornication, 38.3 per cent of those committed for malicious mischief and trespassing, 36.9 per cent of those committed for vagrancy, 35.9 per cent of those committed for drunkenness and disorderly conduct, and 35.2 per cent of those committed for assault. It must be recognized, of course, that for the most part persons committed for vagrancy had no occupation at the time of their arrest, and that although in many cases vagrants who reported that they had been general laborers may once have been so, the majority of them probably reported this occupation merely for want of any other.

The number of male prisoners and juvenile delinquents committed during 1910 who had been engaged in each of the occupations reported by 100 or more of their number, together with the percentage of the total committed for each of the principal offenses, is shown in Table 166, on the following page.

Drunkenness and disorderly conduct constituted the chief specific offense classification shown for every occupational group given for males committed in 1910, except bankers, electric-railway conductors, and messenger, errand, and office boys, and for the first two of these groups this offense classification ranked second, while for the last it ranked third. For the bankers and messenger, errand, and office boys committed the leading offense was larceny, while the leading offense for the electric-railway conductors was vagrancy. The offense classification ranking second in the case of messenger, errand, and office boys was "offenses peculiar to children." Drunkenness and disorderly conduct accounted for over 50 per cent of the commitments of male prisoners and juvenile delinquents in 1910 in over one-half of the occupations given, and for 40 per cent or over in more than four-fifths of the occupations. Of the tanners 74.7 per cent were committed for these offenses, of those in the Army and Navy service 74.1 per cent, and of the hat makers 68.1 per cent.

Vagrancy was second in importance among the offenses shown separately as regards number of commitments of males in the case of 40 occupations, and larceny in the case of 33 occupations. Among the electric-railway conductors committed in 1910 the percentage committed for vagrancy was greater than in the case of any other occupation, a fact which possibly indicates that many of them were without regular employment, but were reported as electric-railway conductors because they incidentally had worked as such, perhaps as strike breakers. The occupational group showing the highest percentage committed for larceny is that comprising messenger, errand, and office boys, followed in turn by newsboys and by laundry workers.

Table 166

MALE PRISONERS AND JUVENILE DELINQUENTS COMMITTED IN 1910.

OCCUPATION.	Total.	Per cent committed for—																
		Grave homicide.	Lesser homicide.	Assault.	Robbery.	Burglary.	Larceny.	Fraud.	Forgery.	Rape.	Fornication.	Drunkenness and disorderly conduct.	Vagrancy.	Violating liquor laws.	Malicious mischief and trespassing.	Offenses peculiar to children.	Offenses ill-defined or not reported.	All other offenses.

[1] Less than one-tenth of 1 per cent.

Of the 48,566 female prisoners and juvenile delinquents committed in 1910, as shown in General Table 108 (p. 490), 25,426, or over one-half, reported an occupation prior to commitment. In the total population 10 years of age or over, only 23.4 per cent of the females were reported as having gainful occupations in 1910. The relatively large proportion of female prisoners and juvenile delinquents reporting an occupation indicates that women of the wage-earning class are more liable to be committed to prisons, jails, and reformatories, and presumably they are more likely to be guilty of penal offenses, than are their more sheltered sisters. Over two-thirds of the female prisoners and juvenile delinquents who reported an occupation (67.6 per cent) had been domestic servants, while in the total population only 16.2 per cent of the females reporting an occupation were domestic servants. Laundresses formed the next largest group (11.8 per cent) of the females committed who reported an occupation. Drunkenness and disorderly conduct accounted for 58.8 per cent of the commitments of females, and constituted the leading cause of commitment for each occupation shown, followed in the case of five occupations by prostitution and fornication, although these latter offenses were responsible for but 9.2 per cent of the total number of commitments of females.

JUVENILE OFFENDERS.

By Reginald L. Brown, A. M.

IMPORTANCE OF THE SUBJECT.

The subject of juvenile delinquency has in recent years come to be regarded as one which should receive entirely separate consideration from that of crime in general. This is in recognition of the fact that in its causes, the problems to which it gives rise, and the methods by which it may best be treated, juvenile delinquency differs from the lawbreaking of adults. There is not the same presumption of a wilful violation of the law in the case of the juvenile offender as in the case of an adult who supposedly has arrived at years of discretion and responsible judgment; the offenses of juveniles, in fact, have their origin in very large measure in thoughtlessness, the exuberance of the youthful temperament, or lack of moral training, and do not contain the same implication of moral obliquity or intentional disregard of the law as do those committed by adults. This very difference in nature, moreover, makes desirable a distinct difference in the manner of imposing correction for the two classes of offenders. In punishing crime in general one of the predominant ideas is that society must be protected from those who wilfully disregard its laws, this protection being obtained to a considerable extent by subjecting the offender to confinement within the walls of a prison. It is only in exceptional cases, however, that juvenile offenders become so grave a menace to society as to make segregation in prisons the only satisfactory way of dealing with them, and even when the main object in view is punishment it is nevertheless generally recognized that the violations of law committed by juveniles should be dealt with more leniently than the corresponding offenses committed by adults. In most, if not all, cases of juvenile delinquency, the primary consideration is, or should be, the education and reform of the offender, and while this is also an important consideration in dealing with adults, the problem is very different when the offender is still in the formative period of life from what it is when his habits and ways of thinking have become more or less fixed. On this very account, moreover, the tendency at the present time is entirely to separate juvenile from adult offenders in court proceedings and to provide distinct institutions for the two classes in cases where it appears necessary to impose institutional restraint, in order that this task of education and reform may not be rendered more difficult by bringing the juvenile into association with depraved and vicious adult lawbreakers. For these reasons, while from the standpoint of the main object of a statistical report on prisoners, namely, the furnishing of a record of the offenses punished by confinement in prisons or reformatories and the extent to which different communities or classes are represented in the commission of these offenses, no special distinction between adult and juvenile offenders may be necessary, yet if the report is to attain its maximum usefulness from a strictly sociological standpoint, it is essential that the data for juvenile offenders should, in addition to being included in the general tabulation for prison inmates, be made the basis for a separate and distinct study.

METHOD OF PRESENTATION.

At each census since detailed statistics of prisoners were first collected, the investigation has included within its scope the inmates of juvenile reformatories.[1] In the reports for the censuses of 1880, 1890, and 1904, however, the statistics for the latter class were not included with those for prisoners, but were tabulated separately, being made, in fact, at the two later censuses the basis of an entirely distinct presentation, although included in the same volume as the report on prisoners. This separation was of course in recognition of the fact already pointed out that there is in many respects an essential difference between juvenile delinquency and the lawbreaking of adults who are presumably possessed of responsible judgment,[2] and that this difference is such as to call for a special type of institution for the custody of those juvenile offenders whose delinquency is sufficiently serious to require institutional restraint. In formulating the plans for tabulating the returns for the census of 1910, however, it was felt that in view of the fact that some states provided no special custodial institutions for their juvenile offenders, but committed them to the same institutions as adult lawbreakers, a continuance of the policy adopted in previous reports of confining the presentation for juvenile delinquents to inmates of reformatories exclusively for this class would be laying undue stress upon the particular type of machinery employed in dealing with this class of lawbreaking. On the contrary, it appeared that the very diversity of methods existing between the states in regard to

[1] It is uncertain whether the inmates of juvenile reformatories were included in the enumerations of prisoners prior to 1880. (Report on the Defective, Dependent, and Delinquent Classes of the Population of the United States as Returned at the Tenth Census (June 1, 1880), p. IX.)

[2] "The term delinquent is applied to criminals and to juvenile offenders, whose acts would be criminal, had their perpetrators arrived at the years of discretion and legal responsibility to the criminal code." (Report on the Defective, Dependent, and Delinquent Classes of the Population of the United States as Returned at the Tenth Census (June 1, 1880), p. IX.)

the treatment of their juvenile offenders was itself a fact of considerable significance which the limitation of the presentation to inmates of juvenile reformatories almost entirely obscured. In other words, it was believed that any study of juvenile delinquency based upon institutional statistics, in order to have the greatest possible value and significance, must cover all juveniles in institutions for the delinquent classes and not merely those in a special type of institution, the fact that the offender is a juvenile being considered more distinctive and significant than the fact that he is confined in an institution exclusively for juveniles.

In addition to the considerations just mentioned as affecting the question from the standpoint of those interested in the problem of juvenile delinquency, a separate presentation of the data relating to the inmates of juvenile reformatories did not seem altogether satisfactory from the standpoint of prison statistics considered as a record of penalized lawbreaking. In so far as juvenile offenders are committed to juvenile reformatories for offenses which if committed by adults would have resulted in their commitment to prisons or jails, their exclusion from the statistics of prisoners results in an incomplete statement of the extent to which the offenses in question are punished by institutional restraint. To the extent that juvenile reformatories care for such offenders, they simply replace the general prisons, and must properly, therefore, be regarded as a part of the regular correctional system. Moreover, since special institutions for juvenile offenders are not found in all states, the exclusion of these institutions from the tabulation for statistics of prisoners creates a certain element of incomparability in the statistics for different censuses, due to the fact that a state having no institutions of this nature at one census but committing all its juvenile offenders to the general prisons or jails may by the time another census is taken have one or more such institutions, so that if the latter are excluded from the tabulation of prisoners the returns for the earlier census will include practically all juvenile offenders, while those for the later census may include comparatively few.[1] In addition, even among the states having special reformatories for juveniles there is considerable variation in the extent to which juvenile offenders are committed to such reformatories, due to differences in the maximum age limit for commitment, in the gravity of the offenses for which commitment to juvenile reformatories is permitted, and in the policy as to commitments to the different classes of penal or reformatory institutions for the two sexes or different races, or to other causes. Until all states have special institutions for juvenile offenders and a uniform law for dealing with such offenders any statistics of prisoners from which inmates of juvenile reformatories are excluded will in certain important respects lack that full degree of comparability as regards different years and different sections of the country which is essential if they are to furnish an accurate indication of existing conditions and tendencies.

In view of all the circumstances just mentioned, it was decided in making the tabulation for the present report to include the inmates of juvenile reformatories with those of prisons and jails, instead of tabulating them separately, as in the reports of the previous censuses, and to substitute for the separate report on inmates of special institutions for juvenile delinquents a section presenting the main facts for all juvenile offenders under 18 years of age whether in juvenile reformatories or in prisons, reformatories, or jails receiving also adult offenders, this age limit being selected because it represented the maximum age for admission to juvenile reformatories existing in any considerable number of states. In making this decision it was recognized that this method of treatment was not in every respect entirely satisfactory, since a considerable number of the inmates of juvenile reformatories are sent there not for specific breaches of the criminal code, but for conduct, such as incorrigibility, which differs essentially in its nature from the crimes and misdemeanors for which adults are committed to prisons. It was believed, however, that this disadvantage could be largely overcome by introducing into the offense classification a group designated "offenses peculiar to children" to which should be assigned all cases where the juvenile had been committed for reasons other than those for which adults are sentenced to prison, and that in other respects the statistics tabulated on this basis would be of much greater significance for a study of the criminalistic classes and afford a more accurate representation of their character and composition than would a presentation confined to certain types of institutions, while, on the other hand, a much more comprehensive and adequate presentation in regard to juvenile offenders would result than if the former policy of confining the study to inmates of institutions exclusively for juveniles were adhered to.

Inasmuch as the prisoners and juvenile delinquents enumerated on January 1, 1910, were not tabulated by age, it has been impossible to segregate those under 18 for the purpose of this special presentation.

[1] Compare in this connection the following:

"Imprisonment as a penalty for minor offenses is being supplanted more and more by reformative measures. Thousands who formerly would have been sent to prisons are now placed on probation or are dealt with by other means than imprisonment. Even where a formal probation system has not been established the tendency is away from imprisonment as the one penalty for offenses of all kinds. Particularly is this true in the case of juvenile delinquents, who a decade ago formed a not unimportant part of the general prison population, but are now more and more disappearing from it. These factors are sufficient * * * to destroy in a notable degree the comparability of the returns with those of previous censuses * * *." (Prisoners and Juvenile Delinquents in Institutions: 1904, p. 13.)

Consequently the tables in this section, with a few exceptions, relate exclusively to juvenile offenders committed during the year 1910.

SUMMARY.

The total number of juvenile offenders under 18 years of age reported as committed to penal or reformatory institutions in 1910 was 25,422. As compared with the total population under 18 years of age, this represents a ratio of 72.9 per 100,000. In view of the fact, however, that children under 10 years of age are not ordinarily considered as capable of committing a violation of the law, a fairer measure of juvenile delinquency would be a comparison between the juvenile offenders 10 to 17 years of age and the total population of the same age. Since 568 of the juvenile offenders reported were under 10 years of age, the number from 10 to 17 years of age committed was 24,854, which represents a ratio of 171.7 per 100,000 of the general population of corresponding age. The corresponding ratio for offenders 18 years of age or over was 820.5 per 100,000 population of the same age. This difference in the ratios for juvenile and adult offenders is of course not surprising, since juveniles lack the opportunity or the temptation to commit many of the crimes for which adults are imprisoned, and it is furthermore the tendency to a considerable degree to send juvenile offenders to a penal or reformatory institution only after all other means of correction have failed.

It should perhaps be noted in the present connection that the number of juvenile offenders as reported falls somewhat short of representing the actual number of juveniles under 18 years of age committed to penal or reformatory institutions. No returns were received from several state reformatories for juveniles, most of them in the South, a fact which should be borne in mind in any comparisons involving the different parts of the country. In certain states, moreover, juvenile delinquents may be committed to private institutions, but returns were secured only from such institutions as cared exclusively for juveniles, private institutions receiving adults as well as juvenile delinquents being excluded from the investigation as primarily benevolent institutions. Even in the case of those private institutions caring exclusively for juveniles, however, there is so much overlapping of functions that it is not always easy to distinguish between those that are exclusively charitable in their character and those that in part perform the functions of juvenile reformatories, so that undoubtedly some institutions for children to which delinquent children are committed by court action have been omitted. The net result of these conditions is to make the reported number of commitments of juvenile offenders somewhat deficient; but the deficiency is probably not sufficiently great to affect the significance of the statistics materially, except to some extent in comparisons for different parts of the country.

It will be observed that the total number of juvenile offenders committed to penal or reformatory institutions exceeds the total number of "juvenile delinquents," as previously defined (see p. 26) by 11,275. This of course indicates that nearly one-half of the juvenile offenders were committed to correctional institutions also receiving adults. The difference would have been even greater were it not for the fact that 587 juvenile delinquents committed to reformatories for juveniles were 18 years of age or over and consequently were excluded from the tabulation for juvenile offenders.

COMPARISON WITH PRIOR CENSUSES.

Comparisons between the total number of juvenile offenders in 1910 and the number at the two earliest censuses for which detailed statistics are available, those of 1880 and 1890, are not possible for the reason that at the earlier censuses the statistics relate exclusively to prisoners and juvenile delinquents enumerated on a given date, and in 1910, as already stated, no age tabulation was made for those enumerated on a given date, making it impossible to segregate the juvenile offenders in prisons for comparison. At the census of 1904, however, statistics as to the number of prison and reformatory commitments were obtained, so that it is possible to make comparisons between 1910 and 1904 as to the number of juvenile offenders committed. Inasmuch as prisoners committed for nonpayment of fine were excluded from the canvass in 1904, it is necessary for purposes of comparison to exclude such prisoners from the figures for 1910 also. Table 167 accordingly shows for 1910 and 1904 the total number of juvenile offenders under 18 years of age committed to penal or reformatory institutions, exclusive of those committed for nonpayment of fine, giving separately the number under 10 years of age and 10 to 17 years of age, respectively, together with the number of the latter per 100,000 general population of the same age. The figures for 1910 are also exclusive of those the nature of whose sentence was not reported, who, in the tabulation of sentence in connection with age, were included with those imprisoned for nonpayment of fine; it is improbable, however, that this occasions any significant degree of incomparability. The statistics contain a further slight element of incomparability resulting from the fact that all juveniles under 10 years of age reported as committed to ordinary penal or reformatory institutions in 1904 were excluded from the tabulation for prisoners on the ground that children under that age found in penal institutions were either neglected children awaiting transfer to other institutions or infants accompanying sentenced mothers; as the number under 10 years of age committed to such institutions in 1910 was, however, only 26, the accuracy of the comparison is not materially affected.

Table 167	JUVENILE OFFENDERS UNDER 18 YEARS OF AGE COMMITTED UNDER SENTENCE OF DEATH OR IMPRISONMENT.			
YEAR.	Total.	Under 10 years of age.	10 to 17 years of age.	
			Number.	Ratio per 100,000 population of same age.
1910	19,342	552	18,790	129.8
1904	[1] 16,972	[1] 661	16,311	121.6

[1] Juvenile offenders under 10 years of age reported as committed to ordinary penal institutions were excluded from the tabulation.

The total number of juvenile offenders under 18 years of age committed to penal or reformatory institutions in 1910 under sentence of death or imprisonment was 19,342, as compared with 16,972 in 1904, representing an increase of 14 per cent for the 6-year period. The commitments under 10 years of age, however, in spite of the exclusion of prisoners of that age in 1904, decreased in number from 661 to 552, or 16.5 per cent (about one-sixth). This decrease appears to be due in part to the exclusion at the census of 1910 of certain institutions included at the earlier census which cared primarily for dependent children; at the same time there is unquestionably an increasing tendency to avoid as far as practicable committing children of that age to institutions. The number from 10 to 17 years of age, on the other hand, increased from 16,311 to 18,790, or 15.2 per cent (somewhat more than one-seventh), while the number per 100,000 population of the same age increased from 121.6 to 129.8. This increase, however, does not necessarily indicate that there has been an actual increase in the prevalence of juvenile delinquency. In part, it merely reflects the fact that certain states which had no reformatories for juvenile delinquents in 1904 had established such reformatories by 1910, as the establishment of a juvenile reformatory usually tends to bring about an increase in the number of juvenile delinquents committed, partly because commitments are made to them for the less serious forms of juvenile delinquency for which commitment to an ordinary penal institution would be regarded as too severe a punishment, and partly because there is less reluctance to commit a juvenile for ordinary breaches of the criminal code where there is a special reformatory for juveniles to which he may be committed than where it is necessary to commit him to a penal institution in which adults are also confined. Moreover, as there is naturally a certain degree of hesitancy about placing a juvenile under the stigma of a criminal charge, it is probable that the enactment of juvenile court laws prohibiting the bringing of criminal charges against juvenile offenders also tends to increase the number of commitments. It is, therefore, possible that the increase in the ratio shown in the table indicates a clearer understanding of the problem of juvenile delinquency and an improvement in the manner of dealing with it fully as much as it does an increase in the seriousness of the problem, in which event of course it is a favorable rather than an unfavorable sign.

As some interest attaches to the development of the policy of separate reformatories for juvenile offenders and also because the returns for such institutions afford the only means of instituting a statistical comparison relative to juvenile delinquency between 1880 and 1890 on the one hand and 1910 on the other, Table 168 is presented, showing the number of juvenile delinquents in reformatories for juveniles reported at each census from 1880 to 1910, inclusive. For the purpose of comparison the ratio per 100,000 of the total population from 10 to 20 years of age, inclusive, is also shown, as the juvenile delinquents committed to special reformatories for juveniles fall mainly within these ages.

Table 168		JUVENILE DELINQUENTS IN REFORMATORIES FOR JUVENILES.			
YEAR.	Total population 10 to 20 years of age.	Enumerated on a given date.		Committed during the year.	
		Number.	Ratio per 100,000 population 10 to 20 years of age.	Number.	Ratio per 100,000 population 10 to 20 years of age.
1910	20,025,365	[1] 25,038	[1] 125.0	[1] 14,197	[1] 70.9
1904	[2] 18,349,419	23,034	125.5	11,814	64.4
1890	14,873,394	14,846	99.8	([3])	([3])
1880	11,840,170	11,468	96.9	([3])	([3])

[1] Includes figures for the Georgia State Reformatory (64 enumerated Jan. 1 and 50 committed during the year), an institution which in this report is classified with the reformatories for adults or for adults and juveniles, but in fact receives juveniles only and therefore, strictly speaking, belongs with the reformatories for juveniles exclusively. When, however, the actual situation in respect to this institution became known to the Bureau of the Census, the publication of the report was too far advanced to permit of a change of classification.
[2] Estimated.
[3] No returns of commitments.

The incomparability previously referred to as existing between the statistics for 1910 and those for 1904 by reason of the exclusion at the earlier census of persons committed for nonpayment of fine does not exist in the case of juvenile delinquents, as none of the juvenile delinquents in reformatories exclusively for juveniles in 1910 were committed for nonpayment of fine.

It is somewhat difficult to determine how far the changes from census to census as shown in the table are actually significant. The considerable increase between 1890 and 1904 is due in large measure to the fact that 13 states which had no separate institutions for juveniles in the earlier year had established such institutions in 1904; it is not improbable, however, that other factors entered in. Apart from the establishment of new institutions of this character, changes in policy as regards the institutional or noninstitutional treatment of juvenile offenders, or as regards the type of institution to which they are committed,

are especially likely to affect the figures; thus the comparatively small change between 1904 and 1910 is apparently due in part to change in policy as regards commitments in the state of New York, where certain large institutions reported a much smaller number of inmates at the later census than at the earlier. There is, moreover, a certain amount of overlapping between institutions primarily reformatory or correctional in their character and charitable or eleemosynary institutions, the former class sometimes receiving juveniles who can not properly be classified as delinquents and the latter frequently also receiving delinquents. On account of this overlapping it is not always easy to differentiate the two types of institution, so that some institutions classified with juvenile reformatories at one census may have been regarded as benevolent institutions at another, with the result of introducing an element of incomparability into the statistics. In short, the conditions affecting the figures are in general so complex that the latter should be regarded as representing merely a rough approximation as to the extent to which juvenile delinquency is dealt with by commitment to a special reformatory institution for juveniles.

Table 169 shows, by geographic divisions and states, the number of juvenile delinquents in reformatories for juveniles reported at each census from 1880 to 1910, inclusive.

[1] Includes figures for the Georgia State Reformatory (64 enumerated Jan. 1 and 50 committed during the year), an institution which in this report is classified with the reformatories for adults or for adults and juveniles, but in fact receives juveniles only and therefore, strictly speaking, belongs with the reformatories for juveniles exclusively. When, however, the actual situation in respect to this institution became known to the Bureau of the Census, the publication of the report was too far advanced to permit of a change of classification.

The most important fact brought out by this table is the steady increase in the number of states containing special reformatory institutions for juveniles. In 1880, 24 states or territories failed to report any special institutions for juvenile delinquents, and in 1890, 23. In 1904 the number, as shown in Table 169, had decreased to 10, while in 1910 the number failing to report such institutions was only 6. Actually there were in 1910 only 3 states having no special reformatories for juveniles, as such institutions were in existence in North Carolina, South Carolina, and Idaho, although no returns were received. Since 1910, 2 of the remaining states, Wyoming and Nevada, have established juvenile reformatories, leaving Mississippi the only state lacking such an institution at the present time.

GEOGRAPHIC DIVISIONS AND STATES.

Table 170 shows the distribution, by geographic divisions and states, of the juvenile offenders under 18 years of age committed to penal or reformatory institutions in 1910, separate figures being presented for those under 10 years of age and those from 10 to 17 years of age, respectively; it also gives the ratio of the juveniles 10 to 17 years of age committed to the general population of the same age.

[1] Includes figures for United States penitentiaries, which are not shown separately in this table.

The ratio of juveniles 10 to 17 years of age committed in 1910 to the general population of the same age was higher in the Middle Atlantic division than in any other (254.9 per 100,000), while New England ranked second, with a ratio of 204.5 per 100,000. The high ratios for these two divisions are of course due in part to their large proportion of urban population, as juvenile delinquency is associated with urban conditions probably to an even greater extent than crime in general. The prominence of these divisions in this respect, however, is doubtless due in some measure to the fact that the policy of separate institutional provision for juvenile offenders has been established for a longer time in these sections of the country and has probably been developed to a greater extent than elsewhere; as previously stated, it seems very probable that there is less reluctance to commit juveniles to penal or reformatory institutions where there is a special institution for such offenders than where it is necessary to send them to the same institution as adult offenders. The ratio was also high (197.6 per 100,000) in the South Atlantic division. This reflects in part conditions in Maryland, where the commitments include a considerable number of dependent children, who properly should not be classed with juvenile offenders; but several of the other states in the division also show high ratios. The ratio was lowest (93.2 per 100,000) in the West South Central division, mainly for the reason that none of the states in this division had reformatories for female juvenile offenders in 1910 and that the state reformatory for juveniles in Oklahoma was not opened until after the beginning of the year. At the same time the exceptionally high percentage of rural population in this division was doubtless an important factor.

The District of Columbia outranked all the states in the ratio of commitments, with 774.3 per 100,000; this is of course due primarily to the fact that it is an urban area, in addition to which the two juvenile reformatories in the District received juvenile delinquents by commitment of the Federal courts from other parts of the United States. Among the states Arizona ranked first, with a ratio of 401.3 per 100,000, possibly on account of its large Mexican population, and Maryland second, with 390.5 per 100,000; the high ratio for the latter state is, however, partly due to the fact that a large Catholic institution in the state cares for destitute children as well as juvenile delinquents and reported both classes. Delaware and Rhode Island also reported ratios in excess of 300 per 100,000 population. The lowest ratio shown is that for Idaho (24.1 per 100,000), but this results mainly from the fact that no returns were received from the state reformatory for juveniles. South Dakota ranked next, with a ratio of 32.7 per 100,000, followed by Wyoming and North Dakota with 35.1 and 37.9, respectively; of these, the two Dakotas are mainly rural in character, while Wyoming had no special reformatory for juveniles in 1910. Other states with ratios of less than 100 per 100,000 were North Carolina (52.9), Iowa (75), Mississippi (75.4), Texas (76.9), Minnesota (84.5), Nebraska (85.4), and Oklahoma (85.7). The reason for the low ratio for

Oklahoma has already been given, while Mississippi had no special reformatory for juveniles in 1910, Texas had no reformatory for female juveniles, and no returns were received from the reformatory in North Carolina; the other states named are very largely rural.

In considering the figures in Table 170, the fact must be emphasized, as has already been done in the case of similar statistics for prisoners, that ratios of this character can not be taken as an accurate index of the relative amount of criminality or delinquency in the respective states. It has already been indicated that the number of commitments is very largely affected by the circumstance whether or not there is a special institution for juveniles, there being much less reluctance to commit for delinquency where such institutions exist than where it is necessary to send the delinquent to one of the ordinary penal institutions to which adult criminals are committed. Even where juvenile reformatories exist, moreover, the character of the law relating to the punishment of juvenile offenders may influence the number of commitments; in states where the procedure still follows the regulations of the criminal code and the juvenile must be sentenced for a specific crime or misdemeanor the natural hesitation to stigmatize him as a criminal may well tend to reduce the number of commitments as compared with a state where the law expressly prohibits the lodging of a criminal charge against anyone under a certain age, permitting the use of such terms only as "incorrigibility" or "delinquency" in trying a juvenile offender. Again, states having special institutions for juveniles and special laws dealing with juvenile delinquency may differ as to the extent to which they employ institutional treatment in dealing with it; in some states the authorities may endeavor to avoid commitment to institutions except as a last resort, relying mainly upon the supervision of the probation officer or other personal agencies, whereas in others they may consider that the advantages of institutional correction so far outweigh its disadvantages as to call for its employment whenever practicable. Variations may also occur as between states in the extent to which the two sexes are committed; some states may commit comparatively few females, while in others there may be no marked distinction made between the sexes as to institutional commitments. Similar differences may also exist as between different racial classes. In short, the extent to which juvenile delinquency is dealt with by punitive or correctional treatment in penal or reformatory institutions is so largely a matter of local policy that ratios of commitments to population do not constitute a fair criterion of the relative amount of such delinquency in different states.

Apart from these differences in policy, differences in local conditions also play an important part in bringing about the variations in the ratios. Mention has already been made in this connection of the relation between urban conditions and juvenile delinquency, and it is not improbable that this relation is even closer than is the case with crime in general; the temptations and opportunities to commit the offenses of the class most common among juveniles are probably greater in cities than in the country, and it is in the city that the social and economic conditions which give rise to juvenile delinquency are most in evidence. Reference has already been made (p. 99) to the fact that one of the leading juvenile offenses, truancy, can exist only where compulsory education laws have been passed. The composition of the population as regards race and nativity is another important factor; as has been shown in earlier sections of this report, the several classes differ distinctly in the extent to which they contribute to the population of penal or reformatory institutions. Still other influences might be named as factors in the differences with respect to the number of juvenile delinquents punished by confinement in penal or reformatory institutions relatively to the total population, but enough has already been said to indicate that the conditions affecting the ratios are so complex as to render it a matter of extreme difficulty to determine the reasons for all the variations in their magnitude.

CLASS OF INSTITUTION.

Table 171 shows for each geographic division and state the distribution according to class of institution to which committed of the juvenile offenders committed during 1910.

Of the 25,422 juvenile offenders under 18 years of age reported as committed in 1910, 13,555, or somewhat more than one-half (53.3 per cent), were committed to reformatories for juveniles only; 10,775, or somewhat more than two-fifths (42.4 per cent), to prisons, jails, or workhouses; and the remainder, 1,092, or about one-twentieth (4.3 per cent), to reformatories receiving both adults and juveniles. It was of course to have been expected that institutions receiving juveniles exclusively should be in the lead; but the fact that so large a number were committed to prisons, jails, or workhouses shows that there is still room for improvement in the methods of dealing with juvenile delinquents.

United States penitentiaries	18	18	(2)	.....	.....	.....	.....

[1] Includes 49 commitments to the Georgia State Reformatory, an institution which in this report is classified with the reformatories for adults or for adults and juveniles, but in fact receives juveniles only and therefore, strictly speaking, belongs with the reformatories for juveniles exclusively. When, however, the actual situation in respect to this institution became known to the Bureau of the Census, the publication of the report was too far advanced to permit of a change of classification.
[2] Per cent not shown where base is less than 100.

The proportion committed to reformatories for juveniles was highest (77.9 per cent, or more than three-fourths) in the Pacific division, which was followed by the East North Central division with 71.7 per cent and New England with 69.4 per cent. It was lowest (27.6 per cent, or somewhat more than one-fourth) in the East South Central division, and next lowest in the South Atlantic (32.2 per cent) and the West South Central (36 per cent). The three southern divisions are in fact the only ones in which the proportion committed to reformatories for juveniles fell below one-half, indicating that in this section of the country old style penal methods still predominate in dealing with juvenile delinquency.

Of the individual states, New Hampshire ranked first in the proportion of juvenile offenders committed to juvenile reformatories, 64 out of 71 juveniles under 18 committed in that state, or about nine-tenths, being sent to the state reformatory for juveniles. Montana ranked next with a percentage of 88.8; Vermont showed the same percentage, but the actual percentage may have been lower, as no returns of commitments were received from the state prison. The percentage was 87.8 in Utah and exceeded 80 in five other states. As already noted, for six states no commitments to juvenile reformatories were reported, although in the case of three of these states this was because no returns were received for the state reformatory for juveniles. Of the three remaining states reporting no commitments to juvenile reformatories, one, Mississippi, was in the East South Central division, and two, Wyoming and Nevada, in the Mountain division. States showing exceptionally low percentages of commitments to such institutions were Florida (2.9), Tennessee (7.9), Georgia (9.4), Texas (19.2), and Alabama (20.7); in the case of Tennessee, however, the actual percentage was considerably higher, as no returns were received from the state institution for juveniles. In seven other states (Pennsylvania, Delaware, Virginia, Arkansas, Oklahoma, New Mexico, and Arizona) the proportion was less than one-half.

The 10,775 juveniles committed to prisons, jails, and workhouses comprised 911 committed to state prisons or penitentiaries, 6,325 committed to county jails or workhouses, and 3,539 committed to municipal jails or workhouses. By reference to General Table 29 (p. 344), it will be seen that of those committed to state prisons or penitentiaries 769, representing 84.4 per cent, or more than five-sixths, of the total, were reported from the three southern divisions, the South Atlantic leading with 273, although the number for the East South Central was nearly as great (271). The proportion which such offenders represented of the total was highest in the West South Central division, however, the 225 juvenile offenders under 18

years of age committed to state prisons or penitentiaries in that division representing 15 per cent, or more than one-seventh, of the total number of such offenders committed. Of the individual states, Texas reported the largest number (104), followed by Alabama with 96 and Georgia and Tennessee with 80 each. The prominence of the South in this respect probably does not mean that the juvenile offenders in this section of the country commit graver crimes than elsewhere, but merely that the correctional methods employed in dealing with juvenile delinquency are still to a considerable extent the same as those employed in dealing with the crimes of adults.

As previously stated (p. 156), owing to the fact that offenders committed for nonpayment of fine were not included at the census of 1904, it is impossible to make any comparison between 1910 and 1904 as to the relative extent to which juvenile offenders generally were sent to juvenile reformatories. Table 172, however, shows for each of these censuses the number of juvenile offenders committed, respectively, to juvenile reformatories and to other penal and reformatory institutions under sentence of death or imprisonment, together with the proportion which these represented of the total. In connection with this table what has already been said (p. 156) as to the comparability of the figures for the two years should be borne in mind.

Table 172

YEAR.	JUVENILE OFFENDERS UNDER 18 YEARS OF AGE COMMITTED UNDER SENTENCE OF DEATH OR IMPRISONMENT.				
	Total.	To reformatories for juveniles.		To other penal or reformatory institutions.	
		Number.	Per cent of total.	Number.	Per cent of total.
1910	19,342	[1] 13,555	[1] 70.1	5,787	29.9
1904	[2] 16,972	11,276	66.4	[2] 5,696	33.6

[1] Includes 49 commitments to the Georgia State Reformatory, an institution which in this report is classified with the reformatories for adults or for adults and juveniles, but in fact receives juveniles only and therefore, strictly speaking, belongs with the reformatories for juveniles exclusively. When, however, the actual situation in respect to this institution became known to the Bureau of the Census, the publication of the report was too far advanced to permit of a change of classification.

[2] Juvenile offenders under 10 years of age reported as committed to ordinary penal institutions were excluded from the tabulation.

As would be expected, in view of the general tendency at present to provide separate institutions for juvenile offenders, the table shows an increase in the proportion committed to juvenile reformatories in 1910 as compared with 1904, the percentage being 70.1 at the later census as compared with 66.4 at the earlier. In view of the fact that certain states which had no special juvenile reformatories in 1910 have since established such reformatories, and that others providing only for males have since established reformatories for females, it is probable that another census will disclose an even greater increase.

Institutions for juvenile offenders differ from those for adult offenders in one important respect, namely, in that while institutions for adults are always under public ownership, juvenile offenders are frequently committed to institutions conducted under private auspices. In view of this fact Table 173 is presented, which classifies the juvenile reformatories from which returns were received in each geographic division according to character of ownership.

Table 173

DIVISION.	REFORMATORIES FOR JUVENILES: 1910.[1]				
	Total.	State.	County.	City.	Private.
United States	100	[2] 57	8	12	23
New England	18	9	5	2	2
Middle Atlantic	17	5	.....	4	8
East North Central	17	10	1	3	3
West North Central	13	12	.....	1	.....
South Atlantic	16	[2] 6	1	.....	9
East South Central	4	2	1	1	.....
West South Central	4	3	.....	.....	1
Mountain	7	6	.....	1	.....
Pacific	4	4	.....	.....	.....

[1] Includes the Georgia State Reformatory, an institution which in this report is classified with the reformatories for adults or for adults and juveniles, but in fact receives juveniles only and therefore, strictly speaking, belongs with the reformatories for juveniles exclusively. When, however, the actual situation in respect to this institution became known to the Bureau of the Census, the publication of the report was too far advanced to permit of a change of classification.

[2] Includes one Federal reformatory and one reformatory operated by the District of Columbia.

The total number of juvenile reformatories from which returns were received was 100, although, as previously indicated (p. 156), this number is somewhat below the number actually in existence. Of these, 77, or a little more than three-fourths, were public institutions and 23, or a little less than one-fourth, private. The South Atlantic division led in the number of private reformatories for juveniles, with 9, followed by the Middle Atlantic, with 8; none were reported from the West North Central, East South Central, Mountain, and Pacific divisions. Of the public institutions, 57, or about three-fourths, were state institutions; the remainder comprised 12 city institutions and 8 county institutions. Of the latter, 5 were in New England, while none were reported from the Middle Atlantic, West North Central, West South Central, Mountain, and Pacific divisions. Of the city institutions, 4 were in the Middle Atlantic division and 3 in the East North Central; none were reported from the South Atlantic, West South Central, and Pacific divisions.

Table 174 shows the distribution by geographic divisions of the juvenile delinquents in reformatories for juveniles on January 1, 1910, classified according to the ownership of the institution, and a similar distribution of the commitments during 1910.

[1] Includes figures for the Georgia State Reformatory (64 enumerated Jan. 1 and 50 committed during the year), an institution which in this report is classified with the reformatories for adults or for adults and juveniles, but in fact receives juveniles only and therefore, strictly speaking, belongs with the reformatories for juveniles exclusively. When, however, the actual situation in respect to this institution became known to the Bureau of the Census, the publication of the report was too far advanced to permit of a change of classification.

[2] Includes one Federal reformatory and one reformatory operated by the District of Columbia.

[3] Less than one-tenth of 1 per cent.

Of the inmates of juvenile reformatories on January 1, 1910, nearly two-thirds (65.1 per cent) were in state reformatories, and more than one-fourth (26.2 per cent) in private reformatories, these two classes comprising more than nine-tenths (91.3 per cent) of the total. The juvenile reformatory reporting the largest number of inmates on January 1 was in fact a private reformatory, the New York Catholic Protectory, with 1,369 inmates, the next largest being the Ohio Boys Industrial School, a state reformatory, with 1,161 inmates. Inmates of city reformatories formed 6.2 per cent of the total and inmates of county reformatories 2.5 per cent of the total. The distribution varied very greatly in the individual geographic divisions, all of the juvenile delinquents enumerated January 1 in the Pacific division and more than nine-tenths of those in the Mountain and West North Central divisions being in state reformatories, whereas in the South Atlantic and Middle Atlantic divisions more than three-fifths (62.5 and 61.5 per cent, respectively) were in private reformatories. The proportion in private reformatories was also high in the West South Central division (32.3 per cent, or nearly one-third), but in no other division was it as much as 10 per cent. The proportion in county reformatories was highest (14.6 per cent, or about one-seventh) in New England and that in city reformatories highest (22.4 per cent, or more than one-fifth) in the East South Central division; in no other division did inmates of either class of institutions form as much as 10 per cent of the total.

The distribution of the commitments according to the character of ownership of the reformatory shows several rather pronounced differences from the distribution of the inmates on January 1. State reformatories reported a substantially smaller proportion of the commitments than of the population on January 1 (57.1 per cent, or less than three-fifths, as compared with 65.1 per cent). Private reformatories, on the other hand, had a slightly larger and city reformatories a considerably larger representation relatively among the commitments than in the enumerated population. In the Middle Atlantic division, as well as in the South Atlantic and West South Central divisions, more than one-half of the commitments were to private reformatories. In five of the six divisions having city reformatories commitments to such reformatories formed at least 10 per cent of the total, although in only one division was this true of the enumerated population, indicating that juveniles are committed to such institutions for relatively short terms, and that as regards this class of offenders city reformatories probably take the place to some extent of municipal jails. The proportion of commitments to county reformatories does not, however, differ very materially from the proportion of juvenile delinquents enumerated in these institutions on January 1

OFFENSE.

Table 175 classifies the juvenile offenders under 18 years of age committed to penal or reformatory institutions in 1910 in the United States as a whole and in each geographic division according to the offense for which they were committed.

[1] Includes figures for United States penitentiaries, which are not shown separately in this table.
[2] Less than one-tenth of 1 per cent.

More juveniles were committed for larceny than for any other offense, the number being 6,028, or 23.7 per cent (nearly one-fourth) of the total. Disorderly conduct ranked next, with 2,985, or 11.7 per cent of the total. The number committed for the purely juvenile offense of incorrigibility was, however, nearly as great (2,927, or 11.5 per cent of the total). In so far as the juveniles committed for incorrigibility were actually children whom their parents or guardians were unable to control, they differ of course in essential respects from prisoners sentenced for specific violations of the law. To a considerable extent, however, they appear to represent females guilty of sex irregularities, and it is not improbable that they may include a considerable number who were guilty of other acts which if committed by adults would have been punishable as crimes, as the tendency at the present time in dealing with juvenile delinquency is to a large extent to avoid the use of any terms conveying the idea that the offender is a criminal or has committed a crime. For four other offenses—burglary, vagrancy, and the juvenile offenses of delinquency and truancy—the number committed exceeded 1,000. The total number committed for the seven offenses just mentioned was 18,707, representing 73.6 per cent, or nearly three-fourths, of all juvenile offenders under 18 years of age committed.

It will be observed that of the juvenile offenders reported 7,502, representing 29.5 per cent, or more than one-fourth, were committed for causes included under the generic head of "Offenses peculiar to children." For most of these cases (7,240) the reported cause of commitment was either delinquency, incorrigibility, truancy, or dependency. Of these, delinquency probably represents actually in the great majority of cases the commission of acts which if performed by an adult would constitute crimes or misdemeanors, the tendency being more and more at the present time to avoid the very idea of criminal proceedings in dealing with juveniles. In some states, as a matter of fact, the law expressly prohibits the lodging of criminal charges against juvenile offenders under ordinary circumstances. The following, from the law of New York, is perhaps typical:

> A child of more than seven and less than sixteen years of age, who shall commit any act or omission which, if committed by an adult, would be a crime not punishable by death or life imprisonment, shall not be deemed guilty of any crime, but of juvenile delinquency only * * *[1]

Mention has already been made of the fact that incorrigibility also in all probability covers in many cases acts which in the case of adults would be treated as violations of the law, and it also appears probable that truancy may in some cases represent more serious offenses than the violation of the compulsory education law. The large number of commitments for dependency reported, however, results from the fact already mentioned that some institutions receive both juvenile delinquents and dependent children; 562 (constituting 69.5 per cent, or more than two-thirds of the total) were reported from the two states of Maryland and New York and represent mainly commitments to certain Catholic institutions in these states for causes such as "destitution" or "lack of proper guardianship." In some instances, of course, such cases may have represented actual cases of delinquency, but in the main they must be considered as fundamentally different in character and as included in this report solely because the institution to which they were committed cared primarily for cases of juvenile delinquency.

In order to bring out more clearly the difference between adult and juvenile offenders as regards the nature of the offenses for which they are committed, Table 176 shows for offenders 18 years of age or over and under 18 years of age, respectively, committed in 1910 the number of commitments for each of the seven leading offenses for each class, with the percentage which they represented of the total for all offenses and the rank of the specified offense in the commitments for each class. Offenses peculiar to children are excluded, since to a considerable degree they represent offenses which in the case of adults are returned under a more specific name.

Table 176

Offense.	Commitments for specified offense in 1910.[1]				Rank in 1910 in number of commitments[1] of—	
	Adult offenders 18 years of age or over.		Juvenile offenders under 18 years of age.

Drunkenness	170,600	36.4	377	2.1	1	9

[1] Exclusive of those for offenses peculiar to children.

The main differences between adult and juvenile offenders as regards the leading offenses for which they are committed are due to the fact that drunkenness, which ranks first for adult offenders, ranks only ninth for juveniles, while larceny, which ranks fourth for adult offenders, ranks first for juveniles, and that burglary, which ranks only ninth for adults, ranks fourth for juveniles. Disorderly conduct, vagrancy, and assault occupy second, third, and fifth places, respectively, in each case, while the sixth and seventh places are in both instances held by trespassing and fraud, but in different order. Drunkenness of course, as has been

[1] Consolidated Laws of New York, Vol. IV, § 2186, p. 2801.

brought out in an earlier section (see p. 75), is an offense the frequency of which increases rapidly up to middle age, so that it would naturally be expected to be much more important among the commitments for adults than among those for juveniles, while gainful offenses against property are most frequently committed by those at the earliest ages. Drunkenness, as a matter of fact, which was responsible for considerably more than one-third (36.4 per cent) of the commitments of adults reported, contributed only 2.1 per cent of the juvenile commitments for a specific breach of the criminal code. On the other hand, larceny, which was responsible for only about one-twelfth (7.8 per cent) of the commitments of adults, caused one-third (33.6 per cent) of those of juveniles for causes other than offenses peculiar to children, and the corresponding percentages for burglary were 1.6 and 8.7, respectively. For all the other offenses shown in the table the difference in the percentages was small. The general group of offenses designated "Gainful offenses against property" in Table 175 contributed very nearly one-half (47.4 per cent) of the total number of commitments under 18 years of age (exclusive of those for offenses peculiar to children), but only one-eighth (12.6 per cent) of those over that age.

From what has been said in previous connections it is obvious that differences between geographic divisions in regard to the offenses for which juvenile offenders are committed will represent to a very large extent differences in nomenclature or in the general policy followed in trying juvenile offenders and can not be taken as necessarily indicating actual differences in the type of offenses committed. To take a concrete illustration, it is probable that fornication, disorderly conduct, delinquency, and incorrigibility are used more or less interchangeably in trying juveniles for sex offenses, so that the relative importance of these offenses in any particular division will depend largely upon the precise terms used in that division to describe this class of offenses. Again, the offense of larceny may in some states be punished as larceny, and in others merely as delinquency, and "drunkenness" and "disorderly conduct" are similarly interchangeable. The extent to which a given offense appears in the causes of commitment under its own name or under some generic name such as delinquency varies of course with the gravity of the offense, so that it is probable that the figures for the more serious offenses come closer to representing the actual number of commitments for such offenses than do those for minor offenses. Another factor which must be taken into consideration is the extent to which compulsory education laws exist in the respective divisions, as divisions in which such laws are general will naturally show a higher percentage for truancy than divisions in which any considerable number of states have no such laws. In general, however, the significance of any comparison by geographic divisions with respect to the offenses for which juvenile offenders are committed lies rather in the light which it sheds on the policy prevailing in the respective divisions as to the charges specified in the court records than in any indication it may give of the offenses which are actually most common in the different sections of the United States.

Broadly speaking, the geographic divisions fall into two groups with regard to the offenses for which juvenile offenders were committed. Of these, one comprises the six divisions of the North and West, in which the proportion committed for offenses peculiar to children ranged from 34.6 per cent, or more than one-third, in the Middle Atlantic division to 45 per cent, or considerably more than two-fifths, in the Pacific. The other comprises the three southern divisions, in which the proportion committed for this class of offenses ranged from 6.5 per cent in the West South Central division to only 14.2 per cent in the East South Central, the proportion for the South Atlantic division (13.7 per cent) being slightly less than that for the last-named division. This of course is but another illustration of the fact already pointed out that in its treatment of juvenile delinquency the South still adheres very largely to the same methods as are employed in dealing with adult lawbreakers.

Of the individual offenses, larceny was the one most frequently reported in every division except the Pacific, in which it ranked second, "delinquency" being the cause most frequently specified in this division. More than one-fifth of the commitments of juvenile offenders reported were for larceny in every division except the Pacific, where the proportion was 19 per cent. In three divisions—the New England, West North Central, and West South Central—the proportion exceeded one-fourth, while in one, the West South Central, it was nearly one-third (32.6 per cent).

In three divisions, the Middle Atlantic, South Atlantic, and East South Central, disorderly conduct ranked next to larceny in number of commitments among juvenile offenders. Truancy ranked second in two, the New England and Mountain divisions, and incorrigibility in two, the two North Central divisions, while vagrancy ranked second in the West South Central division and larceny, as already stated, in the Pacific division. Of the specific crimes and misdemeanors reported, burglary ranked next to larceny in the New England, West North Central, and Mountain divisions, disorderly conduct in the East North Central division, and vagrancy in the Pacific division. Burglary, however, was reported with the greatest relative frequency from the West South Central division, in which 10.7 per cent of the juvenile offenders committed were committed for this offense, although the proportion was nearly as great in the Mountain division (10.4 per cent).

Table 177 distributes the juvenile offenders committed for the various offenses in 1910 according to the class of institution to which they were committed.

[1] Includes 49 commitments to the Georgia State Reformatory, an institution which in this report is classified with the reformatories for adults or for adults and juveniles, but in fact receives juveniles only and therefore, strictly speaking, belongs with the reformatories for juveniles exclusively. When, however, the actual situation in respect to this institution became known to the Bureau of the Census, the publication of the report was too far advanced to permit of a change of classification.

[2] Per cent not shown where base is less than 100.

Practically all of those committed for offenses peculiar to children were committed to reformatories for juveniles; thus all of those for whom the cause of commitment was reported as "dependency," all but five of those committed for truancy, and over 97 per cent of those committed for "delinquency" and "incorrigibility" were sent to institutions of this nature. It is of course not surprising that states which regard it as desirable to differentiate juvenile offenders from ordinary criminals during court proceedings should also provide a separate institution to receive those for whom reformatory training in institutions seemed required. The proportion sent to juvenile reformatories was also high for those committed for fornication; these were for the most part females, it being the tendency at the present time to consider young females committing sex offenses as requiring reformatory treatment rather than punishment under the strict provisions of the criminal code. The only other offenses for which as many as one-half of the commitments were to reformatories for juveniles were larceny, for which the percentage was 54.4, and forgery, for which it was 55.3.

None of the 43 juvenile offenders committed for violation of the liquor laws was sent to a juvenile reformatory. Outside of this the lowest percentage of commitments to juvenile reformatories was shown in the case of fraud and disorderly conduct, only 2.6 per cent of the juveniles sentenced for each of these offenses being committed to this class of institution, while 96.5 per cent of the former and 96.8 per cent of the latter were sent to prisons, jails, or workhouses. Other offenses for which a low percentage of commitments to juvenile reformatories is shown are gambling (4.3), violating city ordinances (5), trespassing (7.4), and drunkenness (8). In most cases a very low proportion of commitments to juvenile reformatories probably indicates either that the offense was of a very minor character, such as not to call for special reformatory treatment, or else very grave, such as to require severer penalties than are represented by commitment to juvenile reformatories.

In order to bring out somewhat more clearly the character of the offenses for which juvenile offenders are committed to the respective classes of institutions, Table 178 is presented, showing the per cent distribution by offense of the juvenile offenders under 18 years of age committed to each class of institution.

Of the commitments to juvenile reformatories nearly one-fourth (24.2 per cent) were for larceny, incorrigibility ranking second, with about one-fifth (21.1 per cent), while the proportion exceeded 10 per cent in the case of delinquency and truancy; thus 70.8 per cent, or more than two-thirds, of all commitments under 18 years of age to this class of institutions were for one of these four offenses. Disorderly conduct, however, led as cause of commitment to prisons, jails, or workhouses, with 26.8 per

cent, or more than one-fourth, of the total, while larceny ranked second, with 21.6 per cent, or more than one-fifth; these two offenses taken together accounted for nearly one-half (48.3 per cent) of the total, vagrancy, the offense ranking third, contributing only 9.8 per cent. More than two-thirds (67.3 per cent) of the commitments to reformatories for adults and juveniles were for either larceny or burglary, commitments for larceny alone representing nearly two-fifths (38.9 per cent) of the total and commitments for burglary more than one-fourth (28.4 per cent).

[2] Less than one-tenth of 1 per cent.

SENTENCE.

Table 179 classifies according to general nature of sentence the juvenile offenders under 18 years of age committed to penal or reformatory institutions in 1910, separate figures being presented for those committed to the different classes of institutions.

More than three-fourths (76.1 per cent) of the juvenile offenders committed in 1910 were sentenced specifically to imprisonment, less than one-fourth (23.9 per cent) being committed for nonpayment of fine (including the small number for whom the nature of sentence was not reported, who were combined with those committed for nonpayment of fine in the tabulation) and only six being sentenced to death. All of those committed to juvenile reformatories were under a sentence of imprisonment only, none being fined; the fine, which is imposed primarily for purely penal considerations, would hardly be employed where the main object of the treatment applied to the offender is to reform him, as is ordinarily the case where the offender is committed to a juvenile reformatory. Practically all (about 98 per cent) of those committed to state prisons and penitentiaries or to reformatories for adults and juveniles also were committed under sentence of imprisonment. Of those committed to county jails, however, more than one-half (51.5 per cent) were committed for nonpayment of fine (including those whose sentence was not reported) and of those committed to municipal jails practically four-fifths (79.1 per cent).

[1] Includes figures for United States penitentiaries, which are not shown separately in this table.
[2] Includes 49 commitments to the Georgia State Reformatory, an institution which in this report is classified with the reformatories for adults or for adults and juveniles, but in fact receives juveniles only and therefore, strictly speaking, belongs with the reformatories for juveniles exclusively. When, however, the actual situation in respect to this institution became known to the Bureau of the Census, the publication of the report was too far advanced to permit of a change of classification.
[3] Includes those for whom the nature of sentence was not reported.
[4] Less than one-tenth of 1 per cent.
[5] Per cent not shown where base is less than 100.

Table 180 shows the distribution according to length of sentence of juvenile offenders under 18 years of age committed to each class of institutions in 1910 under sentence of imprisonment.

Considerably more than two-fifths (45.8 per cent) of the juvenile offenders committed to penal or reformatory institutions under sentence of imprisonment in 1910 were committed for their minority, and as already stated (p. 43), it is probable that in many of the cases where a definite term was reported the term represented the remainder of their minority, although stated as a definite number of years or months. More than one-fifth (21.5 per cent) were committed for an indeterminate period, this class

and that made up of offenders committed for their minority together comprising 67.3 per cent, or more than two-thirds, of the total. About one-fifth (19.5 per cent) were sentenced for definite terms of less than one year and one-tenth (10.9 per cent) for definite terms of one year or over. The high proportions receiving minority or indeterminate sentences are of course not surprising, as the general tendency is to avoid the definite term where the correctional policy followed is that of attempting to reform the offenders; thus, of the juvenile offenders commited to reformatories receiving also adults, 93.9 per cent were sentenced for an indeterminate period.

[1] Includes figures for United States penitentiaries, which are not shown separately in this table.
[2] Includes 40 commitments to the Georgia State Reformatory, an institution which in this report is classified with the reformatories for adults or for adults and juveniles, but in fact receives juveniles only and therefore, strictly speaking, belongs with the reformatories for juveniles exclusively. When, however, the actual situation in respect to this institution became known to the Bureau of the Census, the publication of the report was too far advanced to permit of a change of classification.
[3] Per cent not shown where base is less than 100.
[4] Less than one-tenth of 1 per cent.

The various classes of institutions differ considerably as regards the term of commitment. Nearly two-thirds (65.3 per cent) of the juveniles under 18 years of age committed to juvenile reformatories were sentenced for their minority, while more than one-fifth (22.6 per cent) were sentenced for an indeterminate period, these two classes comprising 88 per cent, or about seven-eighths, of the total. As already stated, more than nine-tenths (93.9 per cent) of the juvenile offenders committed to reformatories for adults and juveniles under sentence of imprisonment received indeterminate sentences. Among those committed to other classes of institutions under sentence of imprisonment, however, more than nine-tenths were sentenced for definite terms. In the case of those committed to state prisons and penitentiaries, the great majority (84.1 per cent, or more than five-sixths) were committed for terms of one year or over, while among those committed to county and municipal jails more than nine-tenths were committed for definite terms of less than one year, the proportion being 91.1 per cent in the former instance and 96.1 per cent in the latter.

Table 181 shows the distribution according to length of sentence of the juvenile offenders under 18 years of age committed to the different classes of institutions in 1910 under sentence of imprisonment for life or for a definite term.

Of the juvenile offenders under the age of 18 years committed in 1910 under sentence of imprisonment for life or for a definite term, more than three-fifths (63.9 per cent) received sentences of less than one year and somewhat more than one-third (36.1 per cent) sentences for one year or over or for life. Among adult offenders the former class is by far the more numerous, contributing 88.2 per cent of the total, as compared with 11.8 per cent in the case of those receiving sentences of one year or over or for life, and at first sight it appears somewhat surprising that the percentage sentenced for terms of one year or over was so much larger for juveniles than for adults, as the tendency would normally be much stronger to impose light sentences on juveniles. As has already been explained, however, the juveniles receiving sentences of one year or over doubtless include a certain number of cases in which the sentence was actually for minority, although stated as for a definitely specified term; at the same time so far as commitments to juvenile reformatories for definite terms occur at all, they will normally be for relatively long terms, since where the commitment is for purposes of reformation, the term must obviously be long enough to afford a reasonable chance of accomplishing the desired object, which would hardly be the case if the commitment were to be for but a few months. The relatively high percentage receiving such sentences, however, appears in some measure to reflect the practice in certain sections of the country of imposing specific sentences of one year or over for truancy, these sentences possibly representing commitment until the offender has passed the age of compulsory school attendance.

[1] Includes figures for United States penitentiaries, which are not shown separately in this table.

[2] Includes 49 commitments to the Georgia State Reformatory, an institution which in this report is classified with the reformatories for adults or for adults and juveniles, but in fact receives juveniles only and therefore, strictly speaking, belongs with the reformatories for juveniles exclusively. When, however, the actual situation in respect to this institution became known to the Bureau of the Census, the publication of the report was too far advanced to permit of a change of classification.

[3] Per cent not shown where base is less than 100.

[4] Less than one-tenth of 1 per cent.

Among those sentenced for a definite term or for life, the most numerous single class with respect to length of sentence was that comprising those sentenced for less than one month, who represented 25.3 per cent, or one-fourth, of the total, while those sentenced for one month ranked next, with 14.1 per cent of the total, these two classes together representing 39.4 per cent, or about two-fifths, of the total. The third place, however, was held by those sentenced for one year, who formed 12.9 per cent, or one-eighth, of the total. It will be seen that 17 persons under 18 years of age received life sentences, while 14 received the heavier definite term sentences of 20 years or over, which means that under ordinary circumstances they would be well on toward middle age when they were released.

Among the juveniles committed to juvenile reformatories for definite terms the largest class numerically was that comprising offenders sentenced for one year, who represented 24.4 per cent, or practically one-fourth, of the total. Those sentenced for terms of two years were, however, nearly as numerous, representing 24.1 per cent of the total, while those sentenced for either three or four years formed 20.8 per cent, or one-fifth, of the total. Altogether, more than two-thirds (69.2 per cent) of the total came within one of the three classes just mentioned. These were also the most important classes in the case of those committed to state prisons or penitentiaries, the percentages for the classes sentenced for one and two years (26.9 and 25.5, respectively) being slightly higher than those for commitments to juvenile reformatories and the percentage sentenced for three or four years somewhat lower (16.3); these three classes together formed more than two-thirds (68.7 per cent) of the total shown for institutions of this character. Three-fifths (33 out of 55) of the juveniles committed to reformatories for adults and juveniles for definite terms were sentenced for one year. In the case of those committed to county or municipal jails, however, offenders sentenced for less than one month constituted the leading class, the proportion which they formed of the total being somewhat higher for the municipal than for the county jails (43 per cent, or more than two-fifths, as compared with 37.6 per cent, or somewhat less than two-fifths). In both instances those sentenced for one month ranked next in importance, representing more than one-fifth of the total (21.1 and 21.5 per cent, respectively), while those sentenced for three months ranked third, with slightly more than 10 per cent of the total, although in the case of commitments to municipal jails those receiving sentences for two months were nearly as numerous. For both classes of jails offenders sentenced for one month or less represented about three-fifths of the total committed for definite terms or for life (59.1 per cent in the case of county jails and 64 per cent in the case of municipal jails).

General Table 114 (p. 520) shows for each division and state the distribution according to sentence of the juvenile offenders under 18 years of age committed in 1910. Table 182 shows the distribution by divisions, with percentages.

Table 182 — JUVENILE OFFENDERS UNDER 18 YEARS OF AGE COMMITTED IN 1910.

[1] Includes those for whom the nature of sentence was not reported.
[2] Includes figures for United States penitentiaries, which are not shown separately in this table.
[3] Less than one-tenth of 1 per cent.

One of the most striking features of this table is the high proportion of commitments for nonpayment of fine in the South, more than two-fifths (41.3 and 41.8 per cent, respectively) of those committed in the South Atlantic and East South Central divisions and considerably more than one-third (36.2 per cent) of those in the West South Central division having been sentenced to pay a fine and committed for nonpayment (including those for whom the nature of sentence was not reported). The highest proportion shown for any other division was 19.9 per cent, or about one-fifth, in the Middle Atlantic. In the Pacific division, on the other hand, only 7.2 per cent, or about 1 in 14, of the juveniles committed were committed for nonpayment of fine. Of the 6 juveniles committed under sentence of death, 2 each were reported from the South Atlantic and Mountain divisions, and 1 each from the Middle Atlantic and Pacific divisions.

Table 183 shows for each geographic division the distribution according to length of sentence of the juvenile offenders committed in 1910 under sentence of imprisonment.

Offenders committed for their minority were the most numerous class in every division except the West South Central, in which those receiving definite sentences of one year or over were more numerous, forming 39 per cent, or nearly two-fifths, of the total.

[1] Includes figures for United States penitentiaries, which are not shown separately in this table.
[2] Less than one-tenth of 1 per cent.

The proportion of offenders sentenced for their minority was highest (66.4 per cent) in the Pacific division, and exceeded one-half in the Mountain, Middle Atlantic, and New England divisions also; in the West South Central division, however, it was only 7.2 per cent, while in the other two southern divisions it was less than 40 per cent. The proportion receiving indeterminate sentences was highest (38.8 per cent, or nearly two-fifths) in the East North Central division, followed by the West South Central division, with 32.5 per cent, or about one-third; in view of the low percentage committed for their minority in the latter division, however, it appears possible that juveniles actually committed for their minority were in some instances reported as receiving indeterminate sentences. In four other divisions, the New England, Mountain, Pacific, and Middle Atlantic, the proportion receiving indeterminate sentences exceeded one-fifth. In connection with the statistics as to minority and indeterminate sentences, what has already been said as to the omission of juvenile reformatories in certain southern states should be kept in mind, as such commitments are the most common form for this class of institutions. Offenders receiving definite sentences of less than one year constituted a larger proportion of the total in the East South Central division than in any other; they were nearly as numerous there as those committed for their minority, forming 35 per cent, or more than one-third, of the total, while in the South Atlantic division they formed considerably more than one-fourth (29.2 per cent) of the total. Next to the West South Central division, the East South Central division shows the highest percentage of commitments for definite terms of one year or over (27 per cent, or more than one-fourth), the South Atlantic division ranking third, with 17.1; the West North Central and New England divisions were the only ones outside of the South in which such offenders formed as much as 10 per cent of the total. All but 1 of the 17 juveniles receiving life sentences were reported from some one of the three southern divisions, the other instance being in the East North Central; the South Atlantic division led in this respect, with 8, or practically one-half of the total.

Table 184 shows for each geographic division the distribution according to length of sentence of the juveniles under 18 years of age committed in 1910 for life or for a definite term of imprisonment.

[1] Includes figures for United States penitentiaries, which are not shown separately in this table.

[2] Per cent not shown where base is less than 100.

The several divisions show some pronounced variations as regards length of sentence. Nearly two-thirds (65.4 per cent) of the juveniles sentenced for life or for a definite term in the West South Central division were committed for one year or over (including life), while in New England the proportion was one-half (50.7 per cent); in the East North Central division, on the other hand, only 11.4 per cent of the total received such sentences and in the Middle Atlantic only 22.3 per cent.

In every division except the New England, West North Central, South Atlantic, and West South Central, the most numerous single group was that comprising offenders committed for less than one month, and in the New England division this group shared first place with offenders receiving sentences of six to nine years. More than one-half (40 out of 78) of the commitments of juveniles for definite terms in the Pacific division were for less than one month, while in the East North Central and Middle Atlantic divisions the proportion was in excess of one-third, and in the Mountain division but slightly less than one-third; in the South Atlantic division, on the other hand, only 13.5 per cent of the total committed for life or for definite terms received such sentences, in the West South Central 15 per cent, and in New England 15.5 per cent. In the West North Central division juveniles sentenced for terms of three or four years formed the most numerous class, comprising 22.7 per cent, or more than one-fifth, of the total, although those sentenced for less than one month were nearly as numerous, comprising 22.4 per cent of the total. In the South Atlantic division sentences for one month were most common, 15.8 per cent of the total number committed for life or for definite terms receiving such sentences; the number sentenced for one year was, however, nearly as great, comprising 15.2 per cent of the total. More than one-fourth (27.1 per cent) of the commitments of juveniles for life or definite terms in the West South Central division were for a term of two years, commitments for one year and for less than one month following, with 16 and 15 per cent of the total, respectively.

Of the 14 juveniles receiving the longest class of definite sentences, those for 20 years or over, 10 were reported from the West South Central division, while only 1 (in the Pacific division) was reported from outside the South. Practically two-thirds (41 out of 63) of those receiving sentences of from 10 to 19 years were also reported from the South, the South Atlantic division leading in this instance with 21. This prominence of the South in regard to long-term sentences for juveniles brings out further what has already been pointed out, namely, that the South in dealing with juvenile offenders still to a considerable extent adheres to the methods followed in dealing with adult lawbreakers.

AGE.

Table 185 shows the age distribution of the juvenile offenders under 18 years of age committed to penal or reformatory institutions in 1910, together with the ratios per 100,000 general population of the same age.

Table 185

AGE.	JUVENILE OFFENDERS UNDER 18 YEARS OF AGE COMMITTED IN 1910.		
	Number.	Per cent distribution.	Ratio per 100,000 population of same age.
Under 18 years	25,422	100.0	72.9
Under 10 years	568	2.2	2.8
10 years	710	2.8	38.0
11 years	1,016	4.0	59.6
12 years	1,764	6.9	92.3
13 years	2,402	9.4	135.5
14 years	3,169	12.5	171.5
15 years	3,778	14.9	219.5
16 years	4,914	19.3	263.5
17 years	7,101	27.9	397.5

More than one-fourth (27.9 per cent) of the juvenile offenders committed in 1910 were 17 years of age, and about one-fifth (19.3 per cent) 16 years of age, these two groups together comprising nearly one-half (47.2 per cent) of the total. More than three-fifths (62.1 per cent) of the total had completed their fifteenth year. It will be observed that 568 commitments under 10 years of age were reported, although a number of these were for "dependency" and hence do not represent, properly speaking, cases of actual juvenile delinquency. The ratio per 100,000 population of the same age increases regularly with each successive year of age, the greatest increase being that shown for those 17 years of age, for whom the ratio was 397.5 per 100,000 as compared with a ratio of 263.5 for those 16 years of age.

Table 186 shows for each geographic division the number of juvenile offenders under 10 years of age and in each year of age from 10 to 17, inclusive, committed to penal or reformatory institutions in 1910 per 100,000 general population of the same age. The absolute numbers upon which this table is based are shown in General Table 115 (p. 524).

Table 186

DIVISION.	RATIO OF JUVENILE OFFENDERS UNDER 18 YEARS OF AGE COMMITTED IN 1910 PER 100,000 POPULATION OF SAME AGE.								
	Under 10 years of age.	10 years of age.	11 years of age.	12 years of age.	13 years of age.	14 years of age.	15 years of age.	16 years of age.	17 years of age.
United States	2.8	38.0	59.6	92.3	135.5	171.5	219.5	263.5	397.5
New England	7.7	89.6	141.0	151.3	254.5	227.2	194.3	193.3	379.1
Middle Atlantic	4.8	64.4	99.5	178.9	238.0	268.5	311.7	322.0	546.2
East North Central	2.1	41.2	58.0	85.8	122.8	171.3	207.8	205.9	319.5
West North Central	2.0	28.0	43.4	60.6	92.7	117.9	175.3	178.8	282.4

East South Central	1.7	15.5	27.6	43.2	79.7	135.0	203.1	283.9	438.4
West South Central	0.9	12.3	16.6	34.8	48.3	77.7	117.3	204.7	252.0
Mountain	4.0	42.6	70.8	108.0	158.5	181.6	295.9	244.2	410.5
Pacific	1.4	21.6	32.9	59.1	81.5	131.2	185.3	220.6	279.9

When the individual geographic divisions are considered separately, some exceptions appear to the rule that the ratio of commitments increases regularly from one year of age to another which has been pointed out for the United States as a whole. Of these exceptions the most noteworthy is that in New England, where after the age of 13 the ratio decreased with each succeeding year of age up to and including 16, although the ratio for those 17 years of age shows a sharp increase to a figure almost double that for the preceding year. By reference to Table 205 (p. 190) it will be seen that the decrease in the ratio for 14-year-old offenders as compared with those 13 years of age is confined to males, female offenders showing a considerable increase in this case also. From this it appears probable that the decrease in question is largely due to a decrease in the number of commitments for truancy, an offense of considerable importance in New England, which is almost entirely confined to males and which shows a rapid decrease after the age of 13. The decrease in the ratio for 15-year-old offenders is also due mainly to the same cause, although the fact that in Table 205 females show a decrease as well as males indicates that there are other contributing factors.

The decrease in the ratio for delinquents 16 years of age in New England, however, and the similar decrease shown for the East North Central and Mountain divisions, the only exceptions outside New England to the rule of an increase in the ratio with each successive year of age are somewhat more difficult to explain. These three divisions, in fact, together with the Middle Atlantic and West North Central divisions, which show only a slight increase, form a group by themselves, the substantial increase in the ratio which is shown for the United States as a whole reflecting mainly conditions in the three southern divisions. It is probable that this situation is due to a combination of factors. To a considerable extent it doubtless results from a decrease in the number of commitments to reformatories for distinctly juvenile offenses which the increase in commitments for ordinary crimes and misdemeanors is not sufficiently great to offset. In addition, the age statistics of the foreign-born whites, who form an important element of the population in the five divisions first mentioned but are relatively few in the South, tend to indicate that there is a somewhat larger immigration of persons 16 years of age than of children at the earlier ages, and as such immigrants probably would not figure to any great extent in court proceedings until they had been in the United States for some time, this increase in the population would not be accompanied by a commensurate increase in commitments. Another circumstance which probably plays some part is the fact that the tendency to concentration on even years of age which is noticeable in the age returns for the general population is especially evident for the age of 16, the population reported as 16 years of age in a number of divisions, even among the native whites, being greater than that at any of the four or five years of age immediately preceding, so that the apparent ratio of commitments to population is probably somewhat lower for this age than would be the case if accurate age returns had been received.

A comparison of the ratios for the different divisions brings out some interesting facts in regard to their rank in the ratios at the different ages. New England shows the highest ratio for the first three age classes in the table, comprising children under 10, 10, and 11 years of age, respectively, and also for the 13-year old offenders, and ranked second in the ratio for those 12 and 14 years of age. The Middle Atlantic division ranked first for the ages of 12, 14, 15, and 17, and second in all the remaining groups. The highest ratio for delinquents 16 years of age is shown by the South Atlantic division, which ranked second in the ratio for those 17 years of age and third for those 15 years of age. The Mountain division ranked third in the ratio for every age except 15 (for which it ranked second), 16, and 17. The only other division showing one of the three highest ratios for any year of age is the East South Central, which ranked third in the ratio for 16-year old offenders. The high ratios for New England at the earlier ages probably indicate that the policy of reformatory training for young juvenile delinquents is much further developed there than in other parts of the country; it is possible also that the compulsory education laws are more strictly enforced and that persistent violations are more frequently punished by institutional restraint. The consistent prominence of the Middle Atlantic division of course is due primarily to its high percentage of urban population, although in this division also the system of institutional training for juveniles has reached a high development. The fact that two southern divisions showing low ratios for the earlier years are among the leading divisions in respect to the magnitude of the ratios for the later years may result from the fact that to a considerable extent juveniles can be tried in these divisions only for specific crimes and misdemeanors and can not be committed for general misconduct, a fact which doubtless tends to keep down the number of commitments in the earlier years; it must be borne in mind, however, that no returns were received for certain juvenile reformatories in this section of the country, a fact which would tend to reduce the ratios for the earlier ages more than those for the later. The three southern divisions, as a matter of fact, show a very considerable increase in the ratio for the 16-year old offenders as compared with those 15 years of age, a condition which is found in no other division and is probably due to the fact that these are the only divisions in which the decrease in commitments for specifically juvenile offenses does not largely offset the normal increase at this age in the

number of commitments for ordinary crimes and misdemeanors.

The West South Central division shows the lowest ratio for each age class except that comprising persons 16 years of age, for which the lowest ratio was in the West North Central division. As previously pointed out, none of the states in the former division made any institutional provision for female delinquents, and in one state the juvenile reformatory was not opened until after the beginning of the year, facts which undoubtedly tended to reduce considerably the number of commitments at the earlier ages. The single exception noted is due to the fact that the ratio for the West North Central division, which is consistently low for the later years, was practically the same for the 16-year group as for the 15-year group, while the West South Central shows a considerable increase. Next to the West South Central division, the Pacific division shows the smallest ratio of commitments under 10 years of age and at 17 years of age, the East South Central for the ages from 10 to 13, and the West North Central for the remaining ages with the exception of the 16-year-old group, for which New England shows the second lowest ratio. In the case of the East South Central division, one of the states had no special reformatory for juveniles and the state reformatory in another provided only for white males, while in the case of a third no returns were received from the state reformatory. The low ratios for the West North Central division may be due largely to the fact that this division has the lowest percentage of urban population of any division outside the South.

Table 187 shows the number and percentage of juvenile offenders at each age committed, respectively, to juvenile reformatories and to other penal institutions, and also the per cent distribution by age of those committed to each of the two classes of institutions.

Table 187 — JUVENILE OFFENDERS UNDER 18 YEARS OF AGE COMMITTED IN 1910.

AGE.	Number.			Per cent distribution.			Per cent of total committed to—

[1] Includes 49 commitments to the Georgia State Reformatory, an institution which in this report is classified with the reformatories for adults or for adults and juveniles, but in fact receives juveniles only and therefore, strictly speaking, belongs with the reformatories for juveniles exclusively. When, however, the actual situation in respect to this institution became known to the Bureau of the Census, the publication of the report was too far advanced to permit of a change of classification.

The proportion of juvenile offenders committed to juvenile reformatories was, as would be expected, highest among those under 10 years of age, of whom 95.4 per cent were committed to this class of institution. For those 10 years of age the percentage decreased to 92.7, but among those 11 years of age it increased to 94.6. For the remaining ages covered, however, it shows a regular decrease. Up to the age of 15, the decrease is relatively slow; for the offenders 16 years of age, however, the proportion shows an abrupt drop to 33.6 per cent, or one-third, as compared with 71.1 per cent, or more than two-thirds, for those 15 years of age, while in the last age group, comprising those 17 years of age, it shows a further drop to 11.9 per cent, or less than one-eighth.

The reason for this decreasing percentage of commitments to juvenile reformatories is of course obvious. In the first place, as the age of the offender increases, the considerations making a segregation between adult and juvenile offenders desirable gradually lose their force; there is, for example, a stronger presumption of moral responsibility in a boy of 14 than in one of 10, and in one of 17 than in one of 14, and the evil results of being brought into association with adult offenders are less pronounced. Moreover, the temptation to commit certain of the graver offenses increases with age, and the likelihood that such offenses will be condoned on account of the offender's youth, or regarded as requiring merely reformatory treatment, decreases. Furthermore, it is probable that in states where there are no juvenile reformatories there is more hesitancy about committing such offenders at the earlier than at the later ages. The abrupt drop at the age of 16 in the percentage of commitments to juvenile reformatories is mainly due to the fact that some reformatories of this class receive only children under 16, and it is probable that the further decrease at the age of 17 is to be explained in a similar manner.

The contrast between the two classes of institutions shown in Table 187 as regards the age of the offenders committed is brought out in another way by the columns in the table showing the per cent distribution according to age. Of the juveniles committed to institutions receiving also adults, more than one-half (52.5 per cent) were 17 years of age, and four-fifths (80 per cent) 16 years of age or over, while only 10.7 per cent were under 15. Of those committed to juvenile reformatories, on the other hand, less than one-fifth (18.4 per cent) had completed their sixteenth year, while 61.8 per cent, or more than three-fifths, were under 15 years of age. The most numerous single group among those committed to this latter class of institutions was that comprising children 15 years of age, who represented 19.8 per cent, or about one-fifth of the total, although the proportion represented by children 14 years of age was nearly as great (18.6 per cent). More than one-half (54 per cent) of the juvenile offenders committed to special juve-

nile reformatories were between the ages of 13 and 15.

From the preceding table it is evident that a considerable number of young children are committed to ordinary prisons and jails, and therefore treated presumably as ordinary criminals and lawbreakers. In view of this fact considerable interest would attach to figures showing the exact type of institution to which these children were committed; but the tabulation was not made in such a way as to permit this kind of a presentation by individual ages. Figures showing the total number under 15 years of age committed to the respective classes of institutions, however, are given in Table 188 (p. 178), with percentages, together with similar figures by individual years of age for those from 15 to 17 years of age. Since some interest also attaches to the question as to where such commitments of young children to ordinary penal institutions are most common, figures are also given for the geographic divisions.

It will be seen from Table 188 that a total of 119 children under 15 years of age were committed to state prisons or penitentiaries in 1910. While this number is not large relatively to the total number of commitments at this period of life, representing only 1.2 per cent, it is nevertheless surprising to learn that more than 100 children 14 years of age or younger were committed to the same class of institution as the most heinous type of adult lawbreakers, and the question naturally arises as to whether the situation with respect to the handling of juvenile delinquency can be regarded as satisfactory so long as such a condition can exist. In addition, 1,134 children under 15, forming 11.7 per cent (nearly one-eighth) of the total, were committed to county or municipal jails; while these probably represent in the main children committed for a short time for some trivial offense, the figures emphasize further the fact that there is still considerable room for improvement in the method of dealing with such children. Of those committed to state prisons and penitentiaries, all but 2 (1 in New England and 1 in the Mountain division) were reported from the South, the South Atlantic division leading with 55, while the East South Central division followed with 49. The proportion which commitments to such institutions formed of the total number for children under 15 was highest (7.9 per cent) in the East South Central division; this, however, is partly due to the fact that one of the states in the division has no juvenile reformatory and the further fact that no returns were received from the juvenile reformatory in another state. In addition, three-fourths (74.5 per cent) of the commitments to county or municipal jails were in the South, the proportion which such commitments represented of the total for children under 15 years of age being highest (40.2 per cent, or two-fifths) in the South Atlantic division, while in the East South Central division it was 34.6 per cent, or more than one-third.

When the age distribution of the juvenile offenders committed to the different classes of institutions receiving adults also is compared for the United States as a whole, it will be seen that 17-year-old offenders were most numerous in each case. The proportion which they represented of the total was highest (63.6 per cent, or a little more than three-fifths) among those committed to reformatories for both adults and juveniles, probably because the states having such reformatories in large measure commit to them only the older juveniles and provide special reformatories for the younger juveniles. More than one-half (53.6 per cent) of the juveniles committed to county jails and practically one-half (49.6 per cent) of those committed to municipal jails were 17 years of age; the proportion in the case of state prisons and penitentiaries was, however, somewhat less (45.7 per cent).

[1] Includes figures for United States penitentiaries, which are not shown separately in this table.
[2] Includes 49 commitments to the Georgia State Reformatory, an institution which in this report is classified with the reformatories for adults or for adults and juveniles, but in fact receives juveniles only and therefore, strictly speaking, belongs with the reformatories for juveniles exclusively. When, however, the actual situation in respect to this institution became known to the Bureau of the Census, the publication of the report was too far advanced to permit of a change of classification.
[3] Less than one-tenth of 1 per cent.
[4] Per cent not shown where base is less than 100.

Table 189 shows the per cent distribution according to offense of the juvenile offenders under 18 years of age committed to penal or reformatory institutions in 1910, classified according to age. The absolute numbers on which this table is based are shown in General Table 116 (p. 526).

[1] Less than one-tenth of 1 per cent.

Except in the case of children under 10 years of age, more juvenile offenders were committed for larceny at every age than for any other offense; excluding the earliest group, the proportion which they represented of the total was fairly uniform, ranging from 21.5 per cent in the case of those 17 years of age to 27.6 per cent for those 10 years of age, or from a little more than one-fifth to somewhat more than one-fourth. The percentage fluctuates more or less up to the age of 14, after which it decreases steadily, mainly because of the increase in the opportunity and temptation to commit other offenses. Even among the offenders under 10, however, one-sixth (16.7 per cent) of the commitments were for larceny. Dependency ranked first as a cause of commitment for those in this age group, accounting for practically one-fifth (19.5 per cent) of the total; but those committed for this cause are of course not properly classed as juvenile delinquents. The number committed for truancy and incorrigibility was, however, nearly as great, commitments for these offenses representing, respectively, 18.5 and 17.4 per cent of the total.

Truancy ranked next to larceny as a cause of commitment at the ages of 10 and 11, contributing one-fifth of the total in each case, while incorrigibility ranked third in both cases. The latter offense ranked second at each year of age from 12 to 15, inclusive, accounting for approximately one-sixth of the total in each case, although at the ages of 12 and 13 truancy was nearly as important; beginning with the age of 14, the importance of truancy rapidly diminishes, owing to the fact that school attendance is ordinarily not compulsory after that age. At the ages of 14 and 15 delinquency ranked next to incorrigibility. At the ages of 16 and 17 disorderly conduct ranked next to larceny as a cause of commitment, contributing 17.5 per cent of the total at the earlier age and 21.3 per cent at the later. Incorrigibility ranked third for the 16-year-old offenders and vagrancy for those 17 years old. No cause other than those named was represented by as much as 10 per cent of the total commitments at any of the ages shown in the table.

It will be observed that the proportion of juveniles committed for offenses peculiar to children shows much the same general tendency from one year of age to another as the proportion committed to juvenile reformatories (see Table 187). The percentage was highest (70.6) among those under 10 years of age, then decreased to 59.4 among the 10-year-old offenders, after which it increased slightly in the case of those 11 years of age. For the remainder of the period covered it decreased regularly, at first slowly, then dropping abruptly from 33.9 among those 15 years of age to 16.3 among those 16 years of age, and 5.2 among those 17 years of age. This is of course what was normally to have been expected; the recognition of the undesirability of employing ordinary penal methods in applying correction to juvenile offenders is naturally associated to a large extent with a desire to avoid branding them as criminals, so that when such offenders are sent to juvenile reformatories it is not so likely to be for a specifically charged crime or misdemeanor as when they are committed to ordinary penal institutions. Moreover, the reluctance to charge specific crimes against juveniles will diminish with advancing age in the same way as the objection to committing them to ordinary penal institutions, and at the same time the increase in the number of graver offenses committed will bring about a reduction in both the proportion of commitments to juvenile reformatories and the proportion of commitments for offenses peculiar to children.

Table 190 shows the per cent distribution according to age of the juveniles committed for the respective offenses.

This table brings out in another way the tendency to avoid treating those at the younger ages as criminals. Most of those for whom offenses peculiar to children were stated as cause of commitment were less than 16 years of age, only 15.6 per cent, or less than one-sixth, being 16 or 17. For delinquency and incorrigibility the proportion over 15 was somewhat higher, 21.7 per cent, or somewhat more than one-fifth, of those committed on each charge having reached the age of 16; of those committed for truancy, on the other hand, only 2.3 per cent had reached that age. Larceny, malicious mischief, and fornication were the only other offenses represented by as many as 100 commitments for which more than one-half of the commitments were of juveniles under 16, the percentages being 55.9, 60.5, and 56.1, respectively, or in the neighborhood of three-fifths; in practically every case, however, the majority of the offenders committed had reached the age of 15. More than one-half of those committed for robbery, fraud, prostitution, injuries to common carriers, violating city ordinances, drunkenness, and disorderly conduct were 17 years of age, the proportion being highest (59.4 per cent, or nearly three-fifths) in the case of drunkenness, although that for fraud was nearly as high (58.2 per cent). The proportion who had completed their sixteenth year was, however, highest in the case of fraud (88.3 per cent).

16 years	4,914	1,667	33.9	27.4
17 years	7,101	3,129	44.1	51.5

[1] Includes those for whom the nature of sentence was not reported.

The most interesting fact brought out by this table is the circumstance that even at the earlier ages a certain number of children were reported as having been committed to penal or reformatory institutions for nonpayment of fine, 16 such commitments under 10 years of age, 28 at the age of 10, and 39 at the age of 11 being reported. The proportion which this class of commitments formed of the total was naturally least (2.8 per cent) in the earliest age group, and in general increases slowly with each succeeding year of age up to the age of 15, for which it was 15.6 per cent. Among the juveniles 16 years of age committed, however, the proportion committed for nonpayment of fine was more than twice as great (33.9 per cent, or about one-third) as among those 15 years of age, while among the 17-year-old offenders committed it was 44.1 per cent, or considerably more than two-fifths. More than one-half (51.5 per cent) of the juveniles committed for nonpayment of fine, however, were 17 years of age, and nearly four-fifths (78.9 per cent) were 16 or over.

Table 192 shows the distribution according to age and length of sentence of the juvenile offenders under 18 years of age committed in 1910 under sentence of death or imprisonment.

[1] Less than one-tenth of 1 per cent.

[2] Per cent not shown where base is less than 100.

Juveniles committed for the duration of their minority outnumbered every other class in each age group shown in the table with the exception of that comprising offenders 17 years of age, among whom persons committed for definite terms of less than one year formed the most important class, representing 47.9 per cent, or nearly one-half, of the total. The proportion committed for their minority was comparatively uniform for the age groups from 10 to 15 years, inclusive, being about three-fifths in each case; the range was from 58.1 per cent for those 15 years of age to 61.2 per cent for those 14 years of age. Only one-third (33 per cent) of the 16-year-old offenders sentenced to death or imprisonment, however, were committed for their minority, and only 13.5 per cent of the 17-year-old offenders. The indeterminate sentence ranked next in importance to the sentence during minority for each age group up to and including 15 years, and also ranked second for 17-year-old offenders; for all of the age groups shown the proportion represented by offenders receiving this form of sentence did not vary greatly, the range being from 18.6 per cent for those 14 years of age to 26.1 per cent for those 10 years of age. Among juveniles 16 years of age those receiving a definite sentence of less than one year held second place, with 29.3 per cent of the total. The proportion of definite term sentences of less than 5 years was highest at the latest ages; the proportion receiving sentences of 10 years or over, however, was highest among those under 10 years of age, and the proportion receiving sentences of from 5 to 9 years among those 11 years of age, circumstances which tend further to confirm the suggestion already made that the sentences for definitely specified terms actually include a considerable number of instances where the offender was in reality committed for his minority.

All of the 6 juveniles committed under sentence of death were 17 years of age. Of those receiving a life sentence, 5 were 16 years of age, 4 each 14 and 17 years of age, and 3 were 15 years of age, while 1 12-year-old offender was reported as sentenced for life. More than one-half (55.7 per cent) of those sentenced for their minority were from 13 to 15 years of age, inclusive; of those reported as receiving an indeterminate sentence, however, more than one-half (54.1 per cent) had completed their fifteenth year. One-half (50.3 per cent) of those sentenced for less than one year were 17 years of age and three-fourths (75.5 per cent) had completed their sixteenth year. More than one-half also of those receiving definite sentences of one year but less than five had completed their sixteenth year; for those receiving sentences of from five to nine years, however, the proportion was only one-third.

Table 193 shows the distribution according to age and length of sentence of the juvenile offenders committed in 1910 under sentence of imprisonment for life or for a definite term.

For each year of age from 11 to 14, inclusive, offenders sentenced for a term of one year were more numerous than any other class, representing in the neighborhood of one-fifth of the total in each case, a fact which probably reflects in considerable measure the practice that appears to exist in some sections of imposing definite sentences of one year for truancy. Sentences for less than one month were the most common form for each year of age from 15 to 17, forming in the neighborhood of one-fourth in each case, and ranked next to one-year sentences for each of the years from 12 to 14, although in the case of the 12-year-old offenders the number receiving sentences of two years was the same. It must, of course, be borne in mind that these comparisons do not cover offenders sentenced for their minority or for an indeterminate period, who constitute the two most numerous classes among all juveniles sentenced to imprisonment but are excluded from Table 193, since that table is restricted to those receiving a sentence for life or a definite term expressed in years or months.

Juveniles 17 years of age comprised the most numerous age group in every sentence class for which the per cent distribution by age is shown in the table except the class sentenced for five years, among whom those 15 years old constituted the most numerous group. The proportion 17 years of age tends in general to decrease as the length of sentence increases; it attains its maximum (55.1 per cent) in the case of those sentenced for three months, while it is smallest (18.3 per cent) for those committed for five years. The proportion of 16-year-old offenders was also in general somewhat smaller for the longer than for the shorter terms, although the tendency is by no means as pronounced as in the case of 17-year-old offenders. The explanation for the apparently heavier sentences for the younger offenders lies of course in the fact already mentioned that the longer sentences in many cases are actually during minority, although reported as for a definite term of years. It is probable, however, that juveniles 16 and 17 years of age are to a considerable extent sentenced for minor offenses, such as drunkenness or disorderly conduct, which younger juveniles do not have the same temptation or opportunity to commit, or which when committed by children of that age are punished otherwise than by confinement in penal or reformatory institutions.

SEX.

Table 194 shows the sex distribution of the juvenile offenders under 18 years of age committed to penal or reformatory institutions in 1910, separate figures being given for those under 10 years of age and those 10 to 17 years of age.

Table 194 — JUVENILE OFFENDERS UNDER 18 YEARS OF AGE COMMITTED IN 1910.

AGE.	Total.	Male.	Female. Number.	Female. Per cent of total.	Ratio per 100,000 population of same sex and age. Total.	Male.	Female.
Under 18 years	25,422	21,982	3,440	13.5	72.9	124.9	19.9
Under 10 years	568	523	45	7.9	2.8	5.1	0.4
10 to 17 years	24,854	21,459	3,395	13.7	171.7	294.4	47.2

The 25,422 juvenile offenders under 18 years of age reported as committed in 1910 comprised 21,982 males and 3,440 females, the latter constituting 13.5 per cent, or somewhat more than one-eighth, of the total. Only 45 out of the 568 children under 10 committed were females, these representing 7.9 per cent of the total; of those from 10 to 17 years of age, however, 13.7 per cent were females. The number of male juveniles 10 to 17 years of age committed per 100,000 male population of the same age was 294.4, while the corresponding figure for females was 47.2, or only about one-sixth as great. The corresponding figures for offenders 18 years of age or over were 1,423.7 and 164.9, respectively, the ratio for males being about eight and one-half times that for females. This brings out more clearly what has already been pointed out in an earlier connection (p. 86) that the difference between the sexes as regards the extent to which they are committed to penal or reformatory institutions is less in early youth than at any other period of life.

Table 195 shows for 1910 and 1904 the sex distribution of the juvenile offenders under 18 years of age committed to penal or reformatory institutions under sentence of death or imprisonment, separate figures being given for those under 10 years of age and those 10 to 17 years of age. In connection with this table, however, what has previously been said as to the comparability of the figures for the two censuses must be kept in mind (see p. 156).

Table 195

YEAR.	JUVENILE OFFENDERS UNDER 18 YEARS OF AGE COMMITTED UNDER SENTENCE OF DEATH OR IMPRISONMENT.			
	Total.	Male.	Female.	
			Number.	Per cent of total.
	TOTAL.			
1910	19,342	16,715	2,627	13.6
1904	16,972	14,965	2,007	11.8
	UNDER 10 YEARS OF AGE.			
1910	552	510	42	7.6
1904	661	554	107	16.2
	10 TO 17 YEARS OF AGE.			
1910	18,790	16,205	2,585	13.8
1904	16,311	14,441	1,900	11.6

The proportion of females among the juvenile offenders committed increased somewhat between 1904 and 1910, the increase in the case of the offenders from 10 to 17 years of age being from 11.6 per cent to 13.8 per cent. This probably indicates a greater development of the policy of reformatory treatment in institutions for female juveniles, who are very largely sex offenders, as the fact that some states in 1910 made no special institutional provision for females although making such provision for males suggests that more attention had been given to the best policy in dealing with male delinquency than was the case in respect to females. The differences in the ratios to the general population for the two censuses are shown for offenders 10 to 17 years of age in Table 196.

Table 196

YEAR.	RATIO OF JUVENILE OFFENDERS 10 TO 17 YEARS OF AGE COMMITTED UNDER SENTENCE OF DEATH OR IMPRISONMENT PER 100,000 POPULATION OF SAME SEX AND AGE.		
	Male.	Female.	Coefficient of difference.
	A	B	A ÷ B
1910	222.3	36.0	6.2
1904	213.4	28.5	7.5

The number of male juvenile offenders from 10 to 17 years of age committed under sentence of death or imprisonment increased from 213.4 per 100,000 population of the same sex and age in 1904 to 222.3 per 100,000 in 1910, or only 4.1 per cent, whereas that for females increased from 28.5 to 36 per 100,000, or about one-fourth. As a result, the ratio for males, which was seven and a half times that for females in 1904, was only about six times as great in 1910.

Table 197 shows for each division and state the sex distribution of the juvenile offenders under 18 years of age committed in 1910, separate figures being presented for those under 10 years of age and those 10 to 17 years of age; for the latter the percentage which females form of the total is also given.

[1] Per cent not shown where base is less than 100.

The proportion of females among the juvenile offenders 10 to 17 years of age committed was highest (19.6 per cent, or about one-fifth) in the East North Central division, the East South Central division ranking second with 17.3 per cent. The proportion was lowest (6.1 per cent) in the West South Central division, in which, as already pointed out, none of the states made any special institutional provision in 1910 for female juvenile offenders, the Middle Atlantic division following in this respect with a percentage of 8.8.

Of the individual states, South Carolina shows the highest percentage of females (28.5); this, however, is undoubtedly above the true figure, as no returns were received from the state reformatories for male juveniles. Indiana ranked second, with 24.6 per cent, or about one-fourth, and Maine third, with 23.3 per cent, while the proportion exceeded one-fifth in four other states—Illinois, North Carolina, West Virginia, and Tennessee. Four states—Montana, Idaho, Wyoming, and Nevada—reported no female juveniles, although in the case of Idaho this is probably due to the fact that no returns were received for the state reformatory for juveniles; in Arizona females formed only 1.8 per cent of the total number and in Oregon only 2 per cent.

Table 198 shows for each geographic division the number, respectively, of male and female juvenile offenders 10 to 17 years of age committed to penal or reformatory institutions in 1910 per 100,000 population of the same age and sex.

Table 198

DIVISION.	RATIO OF JUVENILE OFFENDERS 10 TO 17 YEARS OF AGE COMMITTED IN 1910 PER 100,000 POPULATION OF SAME SEX AND AGE.	
	Male.	Female.
United States	294.4	47.2
New England	350.9	58.4
Middle Atlantic	465.6	44.8
East North Central	243.3	60.4
West North Central	204.3	38.6
South Atlantic	330.0	63.8
East South Central	245.2	52.6
West South Central	173.5	11.4
Mountain	325.7	41.0
Pacific	225.6	30.4

The ratio for males was highest (465.6 per 100,000) in the Middle Atlantic division, while the New England division ranked second with 350.9 per 100,000; in the case of females, however, the highest ratio was that for the South Atlantic division (63.8 per 100,000) and the next highest that for the East North Central (60.4 per 100,000), the New England and Middle Atlantic divisions ranking third and fifth, respectively. These differences between the sexes as regards the divisions showing the highest ratios appear to result largely from the stricter attitude in the two divisions last named as regards compulsory school attendance, as commitments for truancy, an offense which is mainly committed by males, are much more numerous in these divisions than in any other; but it is not improbable that the variations may to some extent reflect differences in the degree to which the policy of reformatory treatment in institutions has been developed for the two sexes. Differences in the completeness of the returns constitute another factor, as certain of the institutions to which reference has already been made as having been omitted were for males only; in particular, it is probable that the ratio for males in the South Atlantic division would have been higher if full returns had been received. For both males and females the West South Central division shows the lowest ratio, the figures being 173.5 and 11.4 per 100,000, respectively; for males the West North Central division held second place in this respect, while for females the Pacific division held this position.

Table 199 shows for each division the distribution according to class of institution to which committed of the male and female juvenile offenders, respectively, committed to penal or reformatory institutions in 1910.

[1] Includes commitments (49 males) to the Georgia State Reformatory, an institution which in this report is classified with the reformatories for adults or for adults and juveniles, but in fact receives juveniles only and therefore, strictly speaking, belongs with the reformatories for juveniles exclusively. When, however, the actual situation in respect to this institution became known to the Bureau of the Census, the publication of the report was too far advanced to permit of a change of classification.

[2] Includes figures for United States penitentiaries, which are not shown separately in this table.

[3] Per cent not shown where base is less than 100.

The proportion of male juvenile offenders committed to prisons, jails, or workhouses was somewhat greater than that of female, the percentages being 43.3 and 36.2, respectively, and the percentage committed to reformatories for adults and juveniles was also higher, 4.5 as compared with 3.2. Of the female

offenders, on the other hand, 60.6 per cent, or three-fifths, were committed to reformatories for juveniles only, as compared with 52.2 per cent, or a little more than one-half, of the males. These differences are of course explained in part by the differences in the nature of the offenses for which the offenders are committed, females being committed very largely for sex offenses, for which the desirability of reformatory rather than strictly penal treatment is much more readily recognized than in the case of the offenses more usually committed by boys; in addition, the undesirability of committing juveniles to ordinary penal institutions is more obvious in the case of female offenders.

Table 200 shows by class of institutions in somewhat greater detail the sex distribution of the juvenile offenders committed in 1910 for the United States as a whole.

Table 200

CLASS OF INSTITUTION.	JUVENILE OFFENDERS UNDER 18 YEARS OF AGE COMMITTED IN 1910.			
	Total.	Male.	Female.	
			Number.	Percent of total.
All classes	25,422	21,982	3,440	13.5
State prisons and penitentiaries [1]	911	864	47	5.2
Reformatories for adults and juveniles	1,092	981	111	10.2
Reformatories for juveniles [2]	13,555	11,472	2,083	15.4
County jails and workhouses	6,325	5,743	582	9.2
Municipal jails and workhouses	3,539	2,922	617	17.4

[1] Includes figures for United States penitentiaries, which are not shown separately in this table.

[2] Includes commitments (49 males) to the Georgia State Reformatory, an institution which in this report is classified with the reformatories for adults or for adults and juveniles, but in fact receives juveniles only and therefore, strictly speaking, belongs with the reformatories for juveniles exclusively. When, however, the actual situation in respect to this institution became known to the Bureau of the Census, the publication of the report was too far advanced to permit of a change of classification.

This table brings out the interesting fact that while the proportion of females was considerably higher among those committed to juvenile reformatories than among those committed to ordinary penal or reformatory institutions, the highest proportion shown by any class of institution was that for municipal jails or workhouses, 17.4 per cent, or more than one-sixth, of the total number of juveniles committed to such institutions being females. The explanation for this may lie in the fact that sex offenses, which probably constitute the most frequent class of offenses for juvenile females, are doubtless more common, or at least more frequently meet with legal prosecution, in cities, and in so far as they are punished by institutional restraint at all, are punished by commitment to a reformatory or to a local jail or workhouse. The proportion of females among juveniles committed to state prisons and penitentiaries was only 5.2 per cent, or about 1 in 20. The proportion among those committed to county jails was lower than that for either class of reformatories.

When the figures for the different geographic divisions in Table 199 are compared, some interesting differences appear in regard to the extent to which the two sexes are committed to the different classes of institutions. As has already been seen, the proportion committed to prisons, jails, or workhouses was larger for males than for females for the United States as a whole; in the three southern divisions, however, the reverse was the case, all of the females committed in the West South Central division, four-fifths (79.6 per cent) of those in the South Atlantic, and three-fourths (75.5 per cent) of those in the East South Central being committed to prisons, jails, or workhouses, as compared with corresponding percentages of 60.4, 65.6, and 71.8 for males. This exception to the rule results from the fact that in several of the southern states in 1910 no special institutional provision for female delinquents was made, although such institutions were provided for males, so that where female delinquents were committed at all it was necessarily to an ordinary penal institution. Outside of the South, the highest percentage of commitments to prisons, jails, and workhouses for females was 28.3 in the West North Central division, while in four divisions, the Mountain, New England, Pacific, and East North Central, the proportion was less than one-tenth. The proportion committed to special reformatories for juveniles was higher (92.1 per cent) in the East North Central division than in any other division for which percentages are given in the table; it was even greater, however, in the Mountain and Pacific divisions, from which less than 100 commitments were reported. The distribution of the male offenders by class of institutions, by reason of the fact that the great majority of the offenders committed were males, corresponds in general rather closely to that for both sexes combined, the percentage committed to prisons, jails, or workhouses being highest (71.8) in the East South Central division and lowest (20.4) in the Pacific division.

By reference to General Table 109 (p. 493) it will be seen that in six states (North Carolina, South Carolina, Mississippi, Idaho, Wyoming, and Nevada) all the male juveniles reported were committed to prisons, jails, or workhouses. As already explained (p. 161), either these states had no special reformatories for juveniles in 1910 or no returns were received for such reformatories. Of the states from which at least 100 male juveniles were reported Montana and Washington show the lowest percentage of commitments to prisons, jails, or workhouses (11.2 and 11.8, respectively), although the proportion was even lower in New Hampshire, in which only 5 of the 52 male juveniles committed were sent to such institutions. In addition to the states in which all the males were committed to this class of institutions, there were nine in which all the females were committed to ordinary penal institutions, namely, Virginia, Alabama, the four states of the West South Central division, New Mexico, and Oregon, none of these states making special institutional provision for female juveniles in 1910. On the other hand, in four states, Vermont, North Dakota, Arizona, and Utah, none of the com-

mitments of female juveniles reported were to prisons, jails, or workhouses; the number of commitments in these states, however, was small. Of the states reporting at least 100 commitments of female juvenile delinquents Massachusetts and Ohio show the lowest percentage of commitments to this class of institution, 4.9 in each case.

Table 201 classifies according to offense the male and female juvenile offenders under 18 years of age committed in 1910, and also shows the percentage of females in the total number committed for each offense.

When the distribution according to offense is considered, the two sexes show certain pronounced differences. The nature of these differences may perhaps be brought out most clearly by a comparison of the figures for offense groups. Of the male juveniles committed 37.1 per cent, or considerably more than one-third, were committed for gainful offenses against property. The corresponding proportion for females, however, was only 10.1 per cent. In the case of females, on the other hand, the leading offense group was that comprising offenses peculiar to children, which represented 41.1 per cent, or more than two-fifths, of the total. In the case of males this group ranked second, with 27.7 per cent, or less than one-third, of the total. One-sixth (16.9 per cent) of the females were specifically committed for offenses against chastity, but only 1.2 per cent of the males. There is a closer correspondence between the percentages for the group designated "Offenses against sobriety and good order," which ranks third for males and second for females and represents mainly drunkenness, disorderly conduct, and vagrancy. The proportion for females was, however, somewhat the larger, 23.6 per cent, as compared with 19.4 per cent for males. These differences of course result in part from the different nature of the temptations to which the two sexes are exposed. The pronounced difference in the percentages for the group "Offenses peculiar to children," however, may indicate that more effort is made to shield female juveniles from the stigma of a criminal charge than is the case with male juveniles. Male offenders, moreover, commit to a somewhat greater extent than females the graver offenses which are more likely to be punished by commitment to an ordinary penal institution. A further factor consists in the circumstance that a number of states in which the ordinary practice of criminal procedure is still followed in dealing with juvenile offenders make no special institutional provision for female juveniles and appear on that account to avoid as far as possible committing females at all, so that conditions in these states affect the totals for males to a much greater extent than those for females.

[1] Per cent not shown where base is less than 100.
[2] Less than one-tenth of 1 per cent.

Of the individual offenses, larceny was the one most frequently reported for males, 26 per cent, or more than one-fourth, being committed for this offense. Disorderly conduct ranked second, with 11.3 per cent of the total, and incorrigibility third, with 10 per cent. Burglary, the offense next in importance, contributed 7 per cent of the total. More females were committed for incorrigibility than for any other offense, this being the cause assigned for 21.3 per cent, or more than one-fifth, of the total; it is probable that sexual irregularity was to a very large extent the actual cause. Disorderly conduct ranked next, with 14.4 per cent, and delinquency third, with 13.3 per cent; those committed for these causes were probably to a large extent sex offenders. Fornication was reported as cause in 11.5 per cent of the cases; for no other cause was the proportion as great as 10 per cent, although the percentage for larceny was 9.2. All of the offenders committed for prostitution and more than nine-tenths (91.6 per cent) of those committed for fornication were females. The highest percentage of females shown for any other offense, however, was 25.1 for incorrigibility, although the percentage was nearly as great for delinquency (23.5). Drunkenness, disorderly conduct, and vagrancy were the only other offenses for which females contributed as much as 10 per cent of the total commitments. All of the juveniles committed for rape and gambling were males; of the other offenses for which as many as 100 juveniles were committed injuries to common carriers and fraud show the lowest percentages of females (0.7 and 0.8, respectively), while the proportion was only 1 per cent for burglary and trespassing, 1.5 per cent for robbery, 2 per cent for malicious mischief, and 3 per cent for truancy.

General Tables 111 (p. 502) and 112 (p. 510) classify by offense for each geographic division and state the male and female juvenile offenders, respectively, committed in 1910.

Table 202 distributes by nature of sentence the male and female juvenile offenders committed in 1910.

Table 202

NATURE OF SENTENCE.	JUVENILE OFFENDERS UNDER 18 YEARS OF AGE COMMITTED IN 1910.					
	Total.	Male.	Female.		Per cent distribution.	
			Number.	Per cent of total.	Male.	Female.
All classes	25,422	21,982	3,440	13.5	100.0	100.0
Sentenced to—						
Death	6	6	.....	.....	(1)	.....
Imprisonment	19,336	16,709	2,627	13.6	76.0	76.4
Imprisoned for nonpayment of fine[2]	6,080	5,267	813	13.4	24.0	23.6

[1] Less than one-tenth of 1 per cent.
[2] Includes those for whom the nature of sentence was not reported.

There was no material difference between the sexes as to the general nature of sentence, females forming a slightly larger proportion of those sentenced to imprisonment than of those committed for nonpayment of fine. The 6 juveniles committed under sentence of death were all males.

Table 203 shows the distribution according to length of sentence of the male and female juveniles committed in 1910 under sentence of imprisonment.

Table 203

LENGTH OF SENTENCE.	JUVENILE OFFENDERS UNDER 18 YEARS OF AGE COMMITTED IN 1910 UNDER SENTENCE OF IMPRISONMENT.					
	Total.	Male.	Female.		Per cent distribution.	
			Number.	Per cent of total.	Male.	Female.
Total	19,336	16,709	2,627	13.6	100.0	100.0

Length of sentence not reported	399	387	12	3.0	2.3	0.5

[1] Per cent not shown where base is less than 100.

The proportion of females was higher (19.7 per cent, or about one-fifth) among those receiving an indeterminate sentence than in any other class with respect to length of sentence, and was next highest (14.6 per cent, or one-seventh) among those committed for their minority. Practically one-half (49.3 per cent) of the females committed, in fact, were committed for their minority and nearly one-third (31.3 per cent) for an indeterminate period, these two classes comprising four-fifths (80.6 per cent) of the total; 14.2 per cent received definite sentences of less than one year, the next largest class being those sentenced for two to four years, who constituted 2.3 per cent of the total. Offenders committed for their minority were also most numerous among male juveniles, although the proportion was somewhat smaller than in the case of females (45.3 per cent). Those receiving definite sentences of less than one year, however, ranked next in importance, with 20.4 per cent of the total, although the proportion receiving the indeterminate sentence was practically the same (20 per cent); the three classes just mentioned comprised 85.7 per cent, or nearly seven-eighths, of the total.

Table 204 shows the distribution by length of sentence of the male and female juvenile offenders committed in 1910 under sentence of imprisonment for life or for a definite term.

[1] Per cent not shown where base is less than 100.

The proportion of females was highest (12.8 per cent, or about one-eighth) among those receiving sentences of from six to nine years, who, as already stated, probably to a considerable extent actually represent juveniles committed for the remainder of their minority. Outside of this group, the highest proportion of females occurred in the four groups comprising juveniles sentenced for three months or less, being approximately 10 per cent in each case. All of the juveniles sentenced for life or for 20 years or over and 59 out of the 63 sentenced for from 10 to 19 years were males; of the remaining groups, that comprising juveniles sentenced for one year shows the lowest percentage of females (4.3). Both for males and for females the largest class numerically was that comprising offenders committed for less than one month, and the next largest that comprising those receiving one month terms; the two classes taken together include nearly one-half (48.1 per cent) of the female juveniles committed under sentence of imprisonment for life or a definite term, but somewhat less than two-fifths (38.6 per cent) of the male. In the case of males offenders sentenced for one year ranked third in importance by reason of the frequency with which this sentence was imposed for truancy; such offenders were in fact almost as numerous as those receiving sentences of one month. In the case of females, however, those sentenced for three months ranked third.

Table 205 shows for each geographic division the number of male and of female juvenile offenders under 10 years of age committed and the number from 10 to 17 by individual years per 100,000 general population of the same sex and age. The absolute numbers upon which this table is based are shown in General Table 115 (p. 524).

In the case of male offenders the figures disclose fewer exceptions to the rule of an increase in the ratio with successive years of age than is the case when both sexes are taken together; the only decreases shown, in fact, are in the case of the delinquents 14 and 15 years of age in New England and those 16 years of age in the Mountain division. The decreases in New England, as already explained (p. 175), are mainly due to a decrease in the commitments for truancy; that for the Mountain division is due to a decrease in the number of commitments for all offenses, resulting mainly from the fact that a reformatory for male juveniles in this division appears ordinarily to receive only boys under 16.

The ratios for female offenders show much more irregularity in regard to the general tendency to increase from year to year than do those for males. In New England, after the age of 14 is reached, and in the East North Central division, after the age of 15, each succeeding year of age shows a decrease in the ratio, while in the Middle Atlantic and West North Central divisions the ratios for females 16 years of age show decreases as compared with those for the preceding age group. The Mountain division also shows a decrease for the 13-year-old and 17-year-old groups, although the figures upon which the ratios are based are so small that it is doubtful whether this irregularity has any special significance, while the South Atlantic division shows a decrease for the 11-year-old group. These exceptions are in general probably due to causes explained in a previous connection (p. 175); in particular, it seems probable that there may be less reluctance to commit females for sex irregularities at the earlier ages, when it is possible to commit them to a special reformatory, than later on, when if they are committed at all, it must be to an institution receiving also adult offenders. It is also probable that increasing age brings a greater degree of circumspection, so that sex offenses, when committed, are not so apt to come under observation and hence receive correction, in addition to which the community is perhaps more apt to adopt a *laissez-faire* policy after the age of 16 has been reached than before. Still another possibility is that females of 16 or over may more often escape with the imposition of a fine, in which case of course they would not figure in the commitments at all except in the instances where the fine was not paid.

So far as male offenders are concerned, the table shows no variation as regards the divisions showing the highest and lowest ratios from the situation which exists when both sexes are considered together (see Table 186, p. 174). In the case of females, however, there are a number of differences. New England shows the highest ratio for every group up to and including those 14 years of age, while the East North Central division shows the highest ratio for those 15 years of age and the South Atlantic for the two remaining age groups. No females under 12 years of age were committed in the Pacific division, and none under 11 in the Mountain. No commitments at the ages of 11 or 12 were reported from the West South Central division, although one child less than 10 years old and one 10 years old were reported. For the ages from 13 to 17, inclusive, the West South Central shows the lowest ratio in each case.

RACE, NATIVITY, AND PARENTAGE.

Table 206 shows for both sexes combined and for males and females separately the distribution according to race, nativity, and parentage of the juvenile offenders committed in 1910, separate figures being given for those under 10 years of age and those from 10 to 17 years of age. The number from 10 to 17 years of age committed per 100,000 population of the same age and class is also shown.

[1] Per cent not shown where base is less than 100.

Of the juveniles under 18 years of age committed to penal or reformatory institutions in 1910, 17,972, or 70.7 per cent, were whites and 7,393, or 29.1 per cent, Negroes, while 57, representing only 0.2 per cent of the total, belonged to other colored races. The proportion of Negroes was considerably higher among the commitments between the ages of 10 and 17 than among those under 10, the percentages being 29.3 and 19.7, respectively. The proportion was also larger than among adult offenders 18 or over, of whom only 21.5 per cent were Negroes. The ratio of commitments for the offenders 10 to 17 years of age was 138.6 per

100,000 for whites, as compared with a ratio of 406.5 per 100,000, or nearly three times as great, for Negroes; it is probable, however, that the actual difference was not quite so great, as the deficiencies in the returns due to the fact that no report was received for a number of juvenile reformatories probably affected the figures for whites to a greater extent than they did those for Negroes. The corresponding ratios for adult offenders were 709.7 and 1,825.2 per 100,000, respectively, the latter ratio being about two and one-half times the former. It would appear, therefore, that there is no very pronounced difference between adult and juvenile offenders as regards the difference in the relative magnitude of the contribution which the two races make to the prison commitments, although it is probably slightly greater for juveniles.

Table 207 shows for the geographic divisions and for the states of the three southern divisions the distribution according to class of institution to which committed of the white and Negro juvenile offenders under 18 years of age, respectively, committed to penal or reformatory institutions in 1910.

[1] Includes commitments (23 whites and 26 Negroes) to the Georgia State Reformatory, an institution which in this report is classified with the reformatories for adults or for adults and juveniles, but in fact receives juveniles only and therefore, strictly speaking, belongs with the reformatories for juveniles exclusively. When, however, the actual situation in respect to this institution became known to the Bureau of the Census, the publication of the report was too far advanced to permit of a change of classification.

[2] Includes figures for United States penitentiaries, which are not shown separately in this table.

[3] Per cent not shown where base is less than 100.

In the South the proportion of juvenile offenders committed to prisons, jails, or workhouses was more than twice as great for Negroes as for whites, being 82.5 per cent, or about five-sixths, in the former instance, as compared with 40.6 per cent, or two-fifths, in the latter. This results in part from the fact that in certain southern states the state juvenile reformatories receive white juveniles only, no provision whatever being made for Negroes, so that where Negro juveniles are committed it is of necessity to an ordinary penal institution. Even in the states where there are special juvenile reformatories receiving Negroes, however, the proportion committed to ordinary penal institutions is in most cases considerably higher for Negroes than for whites; in Virginia, for example, the percentages are 79.8 and 34.8, respectively, in Louisiana 35.1 and 16, and in Texas 89.4 and 70.4. How far this may result from the fact that Negro juveniles commit more serious crimes than whites and how far it merely indicates less reluctance to employ ordinary penal methods in dealing with juvenile offenders where Negroes are concerned than whites, it is impossible to state, although it is probable that both factors are contributory. Another possi-

bility that must be considered, however, is that where a juvenile reformatory is not sufficiently large to provide for all the delinquents of both races, the preference is more likely to be given to the whites.

Of the three southern divisions the West South Central shows the highest proportion of commitments to ordinary penal institutions for whites, 48.2 per cent, or nearly one-half; none of the states in this division had any special reformatory for female juveniles, while the reformatory for males in Oklahoma was not opened until after the beginning of the year. For Negroes, however, the East South Central division shows the highest proportion of such commitments, 87.3 per cent, or about seven-eighths. This is due to the fact that one of the states in this division contained no special reformatory for juveniles of either race, while in the case of another state no returns were received from the state institution for juveniles and in the case of a third the state reformatory made no provision for Negro juveniles. The South Atlantic division shows the lowest percentage for white juveniles, 35.8, or somewhat more than one-third, and the West South Central for Negro, 76.4, or a little more than three-fourths.

It will be observed that for three of the states shown in the table, North Carolina, South Carolina, and Mississippi, all the commitments for both whites and Negroes were to ordinary penal institutions; the reason for this has already been given (see p. 158). Other states showing high proportions of such commitments in the case of whites were Florida, where 29 out of 32 white juvenile offenders were committed to ordinary penal institutions; Tennessee, where the proportion was 75.7 per cent, or three-fourths; and Texas, where it was 70.4 per cent, or more than two-thirds. In addition, the proportion was one-half or over in Delaware, Georgia, and Oklahoma. It should be noted, however, that the proportion for Tennessee would be much less if returns had been received from the state institution for juveniles. The District of Columbia reported the lowest percentage (10.8), followed by Louisiana and Maryland, with 16 and 17.1, respectively; in no other state was the proportion as low as one-fourth.

In addition to the states shown in the table in which all the juvenile offenders of both races reported were committed to prisons, jails, or workhouses, two others, Alabama and Arkansas, reported all their Negro juveniles as committed to such institutions, neither of these states having in 1910 any juvenile reformatory that admitted Negroes. In Oklahoma, 78 out of 79 juvenile Negro offenders were committed to ordinary penal institutions, and the proportion exceeded 95 per cent in Florida, Georgia, and Tennessee; the reason for the high proportion for Tennessee has been previously given. The District of Columbia shows the lowest proportion for Negroes also, 17.7 per cent, Louisiana ranking second with 35.1 per cent; West Virginia, Delaware, and Kentucky were the only other Southern states in which the proportion fell below one-half.

As is the case when all prisoners and juvenile delinquents are taken together, the proportion of Negroes was much higher among female juveniles than among male, 39.1 per cent, or about two-fifths, of the females being Negroes, as compared with 27.5 per cent, or somewhat more than one-fourth, of the males. While the latter percentage, however, is considerably higher than the corresponding figure for adults (19.3), this is not true of the percentage for females, 42.8 per cent of the females 18 years of age or over committed being Negroes, a proportion slightly higher than that shown for juvenile offenders.

The ratio of commitments of juveniles 10 to 17 years of age to the general population of the same age was 242.6 per 100,000 for white males, and 670, or 2.8 times as great, for Negro males, as compared with corresponding ratios of 1,263.5 and 2,964.9 in the case of adult offenders, the coefficient of difference in this case being 2.3. In the case of female juveniles the ratios were 32.8 per 100,000 for whites and 148.1 for Negroes, the latter ratio being 4.5 times the former; for adults the figures were 104.4 and 696, respectively, the latter ratio being 6.7 times the former. In other words, while both for adult and juvenile offenders the difference between the races as regards the relative magnitude of their contribution to the prison commitments is greater for females than for males, for males the coefficient of race difference is greater in the case of juvenile offenders than of adults, while for females it is less. In view of the fact that the offenses for which female juveniles are committed consist largely of sex irregularities, it seems very probable that the difference just pointed out may indicate that young Negro females committing such irregularities are less frequently sent to institutions for reformatory treatment than is the case with white females. Moreover, it must be borne in mind that the Negro population is very largely rural, and that sex irregularities are probably either less frequent or less frequently punished in rural districts than in urban.

As shown in Table 206 (p. 191), native whites formed 62.9 per cent, or five-eighths, of the juveniles under 18 committed in 1910, and foreign-born whites 7 per cent. Confining the comparison to the white juveniles, 89 per cent, or nearly nine-tenths, were native and 10 per cent foreign born, the nativity of the remainder not being reported. The proportion of foreign-born whites is in fact much smaller among juvenile than among adult offenders, 26.9 per cent, or more than one-fourth, of the whites 18 years of age or over committed being foreign born. This difference is of course due to the fact that persons of foreign birth are much more numerous in the adult than in the juvenile population, 24 per cent, or nearly one-fourth, of the general white population 18 years or over being foreign born, as compared with only 5.2

per cent of that from 10 to 17 years of age. For juvenile offenders, as for adults, the ratio of commitments was much higher for the foreign born than for the native whites, the number 10 to 17 years of age committed per 100,000 of the general population of the same age being 269.9 for the foreign-born whites as compared with only 130, or less than half as many, for the native whites. This is a much greater difference than exists in the case of adult offenders, for whom the corresponding ratios were 796 and 610 per 100,000, respectively, the former ratio being only one and one-third times the latter. This greater difference between the two nativity classes in the case of juvenile offenders is mainly due to the circumstance that juvenile delinquency is especially associated with urban conditions, and that the foreign-born population is settled in cities to a much greater extent than the native, 72.2 per cent of the total foreign-born white population living in urban communities in 1910 as compared with 44.2 per cent of the native white. In addition, the geographic distribution of the two classes is an important factor, the foreign-born whites being very largely concentrated in divisions where the policy of reformatory treatment for juvenile delinquency has attained its highest development, and being relatively few in the South, where ordinary correctional methods are still largely followed and there is therefore a tendency to avoid committing juveniles except for distinct breaches of the criminal code.

A comparison of the figures for the two sexes discloses the fact that foreign-born whites are somewhat more important among male offenders than among female, representing 10.5 per cent of the total number of white males under 18 committed, but only 5.5 per cent of the white females. As the proportion foreign born in the total white population from 10 to 17 years of age was practically the same for the two sexes (5.1 per cent for males and 5.2 per cent for females) it is evident that the male foreign-born whites must actually make a much larger contribution relatively to the juveniles committed to penal or reformatory institutions than the female. In fact, the number of commitments per 100,000 total population 10 to 17 years of age was more than twice as great for the foreign-born whites as for the native whites in the case of male offenders, the figures being 502 and 225.8, respectively, whereas in the case of females the difference in the ratios for the two nativity classes is for some reason small, the ratio for the foreign born being 35.1 and that for the native 32.3.

Of the native white juveniles committed, 53.8 per cent were reported as of native parentage and 35.3 per cent, or somewhat more than one-third, as of foreign or mixed parentage, while for 10.9 per cent the nativity of their parents was not reported. If it be assumed that the distribution of the latter class as regards parentage was the same as that of the juveniles the nativity of whose parents was reported, persons of foreign or mixed parentage represented 39.6 per cent, or about two-fifths, of all native white juveniles committed. This is a much higher proportion than the corresponding figure for the total native white population 10 to 17 years of age (29.9 per cent, or considerably more than one-fourth), the reason of course being the same as that for a similar variation for the foreign-born whites. It was also somewhat higher than the corresponding percentage for adult offenders (33.4), probably in the main because in the native white population the percentage of foreign or mixed parentage among juveniles 10 to 17 years of age was somewhat higher than that for adults 18 or over (29.9 as compared with 27.1). The ratio of commitments was higher for those of foreign or mixed parentage than for those of native parentage (153.3 as compared with 99.8 per 100,000), the coefficient of difference being 1.5, which is about the same as that for adult offenders (1.3).

The differences between the sexes as regards the extent to which the two classes of the native whites with respect to parentage are represented among the juvenile offenders are on the whole much the same as those existing in the case of the whites as regards general nativity. Of the native white males under 18 years of age committed, 40.7 per cent were of foreign or mixed parentage, as compared with 31.1 per cent of the females. The ratio of commitments, moreover, was much higher for those of foreign or mixed parentage than for those of native parentage in the case of males (277.3 as compared with 170.7 per 100,000), whereas the corresponding ratios for females were practically identical (28.8 and 27.2 per 100,000, respectively).

Table 208 shows for each geographic division the distribution according to race, nativity, and parentage of the juvenile offenders under 18 years of age committed to penal or reformatory institutions in 1910, together with the number 10 to 17 years of age committed per 100,000 of the general population of the same race, nativity, parentage, and age.

The distribution of the juvenile offenders in any division according to race, nativity, and parentage is so largely determined by the corresponding distribution of the general juvenile population that the most significant section of this table is that showing the ratio of commitments to the population 10 to 17 years of age of the same race, nativity, and parentage. It will be observed that in every division the ratio for Negroes was much larger than that for whites, the difference being greatest in the West North Central division, where the ratio for whites was only 95 per 100,000, while that for Negroes was 1,635.7 per 100,000, or more than 17 times as great. This difference, however, is due primarily to the fact that the Negroes in the West North Central division are concentrated mainly in the state of Missouri, which contains several large cities, whereas the greater part of the division is rural in character, with the result that the ratio for whites

was much below the average. In the East North Central division also the difference is very pronounced, the ratio for Negroes being about 10 times that for whites, owing mainly to the fact that the Negroes in this division are concentrated in cities to a much greater extent than are the whites. In the three southern divisions the coefficient of race difference was much smaller, the ratio for Negroes in the West South Central division being only 3.4 times that for the whites, while in the South Atlantic and East South Central divisions the former ratio was only about four times the latter.

[1] Less than one-tenth of 1 per cent.

[2] Per cent not shown where base is less than 100.

In every division for which the basic figures are large enough to be significant, the ratio for the foreign-born whites was larger than that for the native whites. The difference between the ratios, however, was much more uniform than in the case of those for whites and Negroes, being greatest in the Mountain division, where the ratio for the foreign-born whites was about two and three-fourths times that for the native whites. In the East North Central division, which ranked next in this respect, the coefficient of difference was only 1.9, while in the New England division the ratios were approximately equal, the coefficient of difference being only 1.2.

When the two parentage classes among the native whites are compared, however, it will be seen that while for the United States as a whole the ratio for those of foreign or mixed parentage was considerably greater than the ratio for those of native parentage, there are three divisions, the West North Central, West South Central, and Pacific, in which this was not the case. In the West North Central division the difference was especially marked, the ratio for the native whites of foreign or mixed parentage being 51.2 per 100,000, while that for the native whites of native parentage was 89.8 per 100,000, or about one and three-fourths times as great. In New England, on the other hand, the ratio for those of foreign or mixed parentage was 215.9 per 100,000, as compared with a ratio of 134.4 per 100,000 for those of native parentage, while in the Middle Atlantic division the corresponding figures were 257 and 161.6, respectively, the former ratio being in each instance

1.6 times the latter. It is difficult, however, to explain these variations, and it is probable that several causes contribute, such as differences in the geographic distribution of the two classes, in the extent to which they live in large cities, and in the countries of origin of the foreign white stock.

As has already been seen, the ratio of commitments for all classes without distinction of race, nativity, and parentage is higher in the Middle Atlantic and New England divisions than in any other, and this is also true of the whites as a class as well as of the native whites and the two parentage classes into which they are divided. In the case of the foreign-born whites, however, the Mountain division shows the highest ratio, with the Middle Atlantic second, while the East North Central division also shows a higher ratio than New England. In the case of the Negroes the highest ratio for any division for which the basic figures are sufficiently large to make the ratio significant is that for the West North Central, the Middle Atlantic again ranking second.

The two south central divisions show the lowest ratios for the United States as a whole for all classes combined, and this is also true for the whites and Negroes separately, as well as for the native whites as a class and the native whites of native parentage. The West South Central division also has the lowest ratio for the native whites of foreign or mixed parentage; but second place in this respect is held by the West North Central division. In the case of the foreign-born whites the Pacific and West North Central divisions show the lowest ratios of any divisions for which the absolute numbers are large enough to make the ratios of any significance.

LITERACY.

As previously explained (p. 144) no tabulation was made of the returns as to literacy in connection with age, so that statistics on this subject can be presented only for the juvenile delinquents committed to reformatories exclusively for juveniles. Table 209 shows the distribution as to literacy of the total number reported as committed to such institutions in 1910, and also the distribution for males and females separately.

Of the 14,197 juvenile delinquents committed to reformatories for juveniles in 1910, 13,902 are represented in the returns as to literacy. Of these, 1,195, representing 8.6 per cent, or about one-twelfth, were illiterate, as compared with a corresponding percentage of 12.8 for the prisoners committed; the difference is due of course to the fact that the percentage of illiteracy is generally lower at the earlier ages than at the later. For the general population 10 to 19 years of age, the group which comprises most of the juvenile delinquents, the percentage illiterate was only 4.5 in 1910; in other words, there are nearly twice as many illiterates relatively among juvenile delinquents as among the total population 10 to 19 years old. Contrary to the situation among the prisoners committed, the male juvenile delinquents show a somewhat higher percentage of illiteracy than do the female, the figures being 9 and 6.3, respectively. This difference is accounted for by the fact that the percentage illiterate in the general population 10 to 19 years of age was higher for males than for females (5.2 as compared with 3.8), although it is probable that other factors enter in.

Table 209 — JUVENILE DELINQUENTS COMMITTED TO REFORMATORIES FOR JUVENILES IN 1910.[1]

LITERACY.	Number.			Per cent distribution.		
	Total.	Male.	Female.	Total.	Male.	Female.

Reporting as to literacy	13,902	11,703	2,199	100.0	100.0	100.0
Literate	12,707	10,647	2,060	91.4	91.0	93.7
Illiterate	1,195	1,056	139	8.6	9.0	6.3
Not reporting as to literacy	295	254	41	.....	.....	.....

[1] Includes 50 commitments to the Georgia State Reformatory, an institution which in this report is classified with the reformatories for adults or for adults and juveniles, but in fact receives juveniles only and therefore, strictly speaking, belongs with the reformatories for juveniles exclusively. When, however, the actual situation in respect to this institution became known to the Bureau of the Census, the publication of the report was too far advanced to permit of a change of classification.

Table 210 shows for each division and state the distribution according to literacy of the juvenile delinquents for whom returns were secured, together with the percentage illiterate. For comparison, the percentage illiterate in the general population 10 to 24 years of age is given, figures showing the percentage illiterate in the general population 10 to 19 years of age not being available by states.

The South Atlantic division led with respect to the proportion illiterate among juvenile delinquents committed in 1910 to reformatories for juveniles, with 21.5 per cent, or a little more than one-fifth, although that for the West South Central (19.4 per cent) was nearly as great; the East South Central was third, with 11.4. The percentage was lowest (4) in the Pacific division, followed by the East North Central, with 4.6. Of the individual states for which percentages are given in the table, Virginia shows the highest proportion of illiterates (33.1 per cent, or one-third), followed by West Virginia and Louisiana with 28.7 and 25.6 per cent, respectively, while in two other states (Alabama and Nebraska) the proportion was one-fifth or over and in four states (Rhode Island, Pennsylvania, Maryland, and New Jersey), together with the District of Columbia, it was 10 per cent or over but less than 20.

California	347	346	332	14	4.0	1	2.3

[1] Includes 50 commitments to the Georgia State Reformatory, an institution which in this report is classified with the reformatories for adults or for adults and juveniles, but in fact receives juveniles only and therefore, strictly speaking, belongs with the reformatories for juveniles exclusively. When, however, the actual situation in respect to this institution became known to the Bureau of the Census, the publication of the report was too far advanced to permit of a change of classification.
[2] Per cent not shown where base is less than 100.

The lowest percentage for any state with as many as 100 commitments to juvenile reformatories was in Indiana (2); that for Michigan was practically the same (2.1), while for Iowa and Kansas it was only 2.4.

General Table 107 (p. 488) shows for each division and state the number of juvenile delinquents committed to reformatory institutions for juveniles in 1910, classified according to race, nativity, and literacy. Table 211 summarizes the figures for the United States as a whole, giving also for purposes of comparison the percentage illiterate in the general population 10 to 19 years of age in the respective classes.

Table 211

RACE AND NATIVITY.	JUVENILE DELINQUENTS COMMITTED TO REFORMATORIES FOR JUVENILES IN 1910.[1]						Per cent illiterate in total population 10 to 19 years of age: 1910.
	Total.	Reporting as to literacy.				Not reporting as to literacy.	
		Total.	Literate.	Illiterate.			
				Number.	Per cent of total reporting.		
All classes	14,197	13,902	12,707	1,195	8.6	295	4.5
White	12,057	11,806	10,999	807	6.8	251	2.3
Native	10,900	10,673	9,981	692	6.5	227	1.8
Foreign born	1,103	1,088	978	110	10.1	15	9.6
Nativity not reported	54	45	40	5	(2)	9	.....
Negro	2,124	2,080	1,694	386	18.6	44	19.6
Other colored	16	16	14	2	(2)	.....	20.6

[1] Includes 50 commitments to the Georgia State Reformatory, an institution which in this report is classified with the reformatories for adults or for adults and juveniles, but in fact receives juveniles only and therefore, strictly speaking, belongs with the reformatories for juveniles exclusively. When, however, the actual situation in respect to this institution became known to the Bureau of the Census, the publication of the report was too far advanced to permit of a change of classification.
[2] Per cent not shown where base is less than 100.

The three race and nativity classes for which the percentage illiterate among the juvenile delinquents committed is given in the table show the same order in this respect as in the case of prisoners (see Table 162, p. 147). For the native whites the percentage was much higher among juvenile delinquents than in the general population 10 to 19 years of age. In the case of the foreign-born whites, however, it was only slightly higher, possibly because the juvenile delinquents, as compared with the total foreign-born white population from 10 to 19 years of age, comprise a larger proportion between 15 and 19 and the percentage illiterate is much higher for the foreign-born whites from 15 to 19 than for those from 10 to 14. In the case of the Negroes, the juvenile delinquents show a somewhat smaller percentage of illiteracy than the general population from 10 to 19; this is accounted for largely by the fact that the juvenile delinquents of this race came mainly from states where the percentage illiterate among the Negroes in the general population was below the average.

[1] Includes "Nativity unknown."

[2] The Georgia State Reformatory, which in the general tables is classified with the reformatories for adults or for adults and juveniles, in fact, receives juveniles only. It is therefore included here with the reformatories for juveniles exclusively, although when the actual situation in respect to this institution became known to the Bureau of the Census, the publication of the report was too far advanced to permit of a change of classification in the general tables.

[3] Until Oct. 1, 1910, was included in reports for Minnesota State Training School for Boys and Girls, Red Wing.

Adult males, per cent of total population, 21.
Adult offenders, offenses of which convicted, 166.
Adultery, commitments for, 29, 30; by class of institution, 31, 356; divisions and states, 37, 360; sentence, 64, 459; amount of fine, 67; age, 72, 74, 400; sex, 81, 356; relative gravity of offense, 66.
Agricultural laborers, offenses of which convicted, 490.
Architects. *See* Designers, etc.
Army and navy service, offenses of which convicted, 489; per cent distribution, 150.
Arson, commitments for, 29, 164, 188; by sentence, 64, 459; sex, 81, 356; class of institution, 356; divisions and states, 360; age, 400; relative gravity of offense, 66.
Artists, offenses of which convicted, 489.
Assault, commitments for, 28, 30, 36, 164, 166, 188; by class of institution, 31, 356; divisions and states, 37, 360, 403; sentence, 64, 459; amount of fine, 67; age, 72, 74, 400; sex, 81, 356; race, 91, 92, 103; nativity, 112, 123; country of birth, 130; occupation, 489; relative gravity of offense, 66.
Attempted suicide, commitments for, 28; by sentence, 64, 459; sex, 81, 356; class of institution, 356; divisions and states, 360; age, 400.
Austria, white prisoners and juvenile delinquents born in, 128, 334, 339; ratio to population, 129; classified by offense, 130; sex, 132–136, 335, 336; divisions and states, 337; committed for nonpayment of fine, 338.
Authors, editors, and reporters, offenses of which convicted, 489.

Bakers, offenses of which convicted, 489; per cent distribution, 150.
Bankers, offenses of which convicted, 489.
Barbers, offenses of which convicted, 489; per cent distribution, 150.
Bartenders. *See* Saloon keepers, etc.
Bastardy, commitments for, 29; by sentence, 64, 459; class of institution, 356; divisions and states, 360; age, 400.
Belt and pocketbook makers, offenses of which convicted, 489.
Bigamy and polygamy, commitments for, 29; by sentence, 64, 459; sex, 81, 356; class of institution, 356; divisions and states, 360; age, 400; relative gravity of offense, 66.
Blacksmiths, offenses of which convicted, 489; per cent distribution, 150.
Boarding-house keepers, offenses of which convicted, 489.
Bookkeepers. *See* Accountants, etc.
Boot and shoe makers (custom work), offenses of which convicted, 489; per cent distribution, 150.
Boot and shoe operatives, offenses of which convicted, 489; per cent distribution, 150.
Brakemen (steam railway). *See* Conductors, etc.
Brewery and distillery operatives, offenses of which convicted, 489.
Bribery, commitments for, 29; by sentence, 65, 459; sex, 81, 356; class of institution, 356; divisions and states, 360; age, 400.
Brick and tile makers, offenses of which convicted, 489.
Builders and contractors, offenses of which convicted, 489.
Burglary, commitments for, 28, 30, 36, 164, 166, 188; by class of institution, 31, 356; divisions and states, 37, 360, 403; sentence, 64, 459; amount of fine, 67; age, 72, 74, 400; sex, 81, 356; race, 91, 92, 103; nativity, 112, 123; country of birth, 130; occupation, 489; relative gravity of offense, 66.
Butchers, offenses of which convicted, 489; per cent distribution, 150.
Butter and cheese makers, offenses of which convicted, 489.

Canada, white prisoners and juvenile delinquents born in, 128, 334, 339; ratio to population, 129; classified by offense, 130; sex, 132–136, 335, 336; divisions and states, 337; committed for nonpayment of fine, 338.
Carpenters and joiners, offenses of which convicted, 489; per cent distribution, 150.
Carrying concealed weapons, commitments for, 29, 30, 164, 188; by class of institution, 31, 356; sentence, 65, 459; amount of fine, 67; age, 72, 74, 400; sex, 81, 356; divisions and states, 360; relative gravity of offense, 66.
Cashiers. *See* Accountants, etc.
Chain gangs. *See* County jails, etc.
Chastity, offenses against, commitments for, 29, 164, 188; by sentence, 64, 459; sex, 81, 356; class of institution, 356; divisions and states, 360; age, 400.
Chauffeurs. *See* Drivers, etc.
Cheese makers. *See* Butter, etc., makers.
Children, offenses of. *See* Offenses peculiar to children.
Chinese, Japanese, and other colored population, 87, 106.
Chinese, Japanese, and other colored prisoners, 87, 89; by divisions and states, 320; age and sex, 349.
City ordinances, violation of. *See* Violating city ordinances.
Civil officials, offenses of which convicted, 489.
Clergymen, offenses of which convicted, 489.
Clerks (general), offenses of which convicted, 489; per cent distribution, 150.
Clothing makers, offenses of which convicted, 489, 490; per cent distribution, 150.
"Coefficient of difference," term defined, 79.
Colored juvenile delinquents, classified by divisions, 195; literacy, 197; individual institutions, 198. *See also* Colored prisoners, etc.
Colored juvenile offenders, classified by sex, 191; by divisions, 195.
Colored population. *See* Chinese, etc., population.
Colored prisoners and juvenile delinquents, classified by divisions and states, 87, 322; class of institution, 90; offense, 91, 92, 103; sentence, 94–96, 98; age, 99, 350; sex, 101–103; literacy, 147, 148; individual institutions, 204; per cent of total prisoners and juvenile delinquents, 87, 102.
Commercial travelers, offenses of which convicted, 489; per cent distribution, 150.
Conductors (electric railway), offenses of which convicted, 490.
Conductors and brakemen (steam railway), offenses of which convicted, 490; per cent distribution, 150.
Confectioners, offenses of which convicted, 489.
Contempt, commitments for, 29, 30; by class of institution, 31, 356; sentence, 65, 459; age, 72, 74, 400; sex, 81, 356; divisions and states, 360; relative gravity of offense, 66.
Contract, violation of. *See* Violating contract.
Contractors. *See* Builders, etc.
Contributing to delinquency, commitments for, 29, 30; by sentence, 65, 460; amount of fine, 67; age, 72, 74, 401; sex, 81, 358; class of institution, 358; relative gravity of offense, 66.
Coopers, offenses of which convicted, 489.
Counterfeiting, commitments for, 28; by sentence, 64, 459; amount of fine, 67; sex, 81, 356; class of institution, 356; divisions and states, 360; age, 400.
Country of birth, foreign-born white prisoners classified by, 128–136, 334–339, 415.
County jails, workhouses, and chain gangs, summary of, by states, 204.
County jails and workhouses, prisoners and juvenile delinquents committed to, classified by offense, 31, 357, 423; sentence, 43, 44, 315, 431; age, 71, 346; sex, 79, 80, 312, 357; race, 90; nativity, 111; divisions and states, 312; summary of, by states, 204.
—— juvenile offenders committed to, 169–171, 178, 187.
Crime against nature, commitments for, 29, 164, 188; by sentence, 64, 459; sex, 81, 356; class of institution, 356; divisions and states, 360; age, 400; relative gravity of offense, 66.
Criminals, early censuses of, 13.
Cruelty to animals, commitments for, 29, 164, 188; by sentence, 65, 460; sex, 81, 358; class of institution, 358; divisions and states, 362; age, 401; relative gravity of offense, 66.
Cruelty to wife or child, commitments for, 29; by sentence, 65, 460; sex, 81, 358; class of institution, 358; divisions and states, 362; age, 401; relative gravity of offense, 66.

Death, prisoners and juvenile delinquents sentenced to, 41; by class of institution, 43, 314; offense, 64, 384, 459; age, 76, 480; sex, 83, 326, 480; race, 94, 326; nativity, 114, 326; marital condition, 141; parentage, 326; divisions and states, 428, 429, 431–433; comparison with previous censuses, 42.
—— juvenile offenders sentenced to, 169, 172, 182, 189.

Delinquency, commitments for, 29, 164, 188; by class of institution, 31, 358; sentence, 65, 460; age, 72, 74, 401; sex, 81, 358; divisions and states, 362. *See also* Contributing to delinquency.
Deliverymen, offenses of which convicted, 489; per cent distribution, 150.
Denmark, white prisoners and juvenile delinquents born in, 128, 334, 339; ratio to population, 129; classified by offense, 130; sex, 132–136, 335, 336; divisions and states, 337; committed for nonpayment of fine, 338.
Dentists, offenses of which convicted, 489.
Dependency, commitments for, 29, 164, 188; by sentence, 65, 460; sex, 81, 358; class of institution, 358; divisions and states, 362; age, 401.
Designers, draftsmen, architects, and inventors, offenses of which convicted, 489.
Discharges or paroles, by class of institution, 25; sex, 310; summary of, by individual institutions, 205.

Foreign countries, white prisoners and juvenile delinquents born in, 128, 334, 339; ratio to population, 129; classified by offense, 130; sex, 132–136, 335, 336; divisions and states, 337; committed for nonpayment of fine, 338.
Foreign-born population, per cent of total population, 21.
Foreign-born white juvenile delinquents, classified by literacy, 197; individual institutions, 198; country of birth, 339. *See also* Foreign-born white prisoners, etc.
Foreign-born white juvenile offenders, classified by sex, 191; divisions, 195.
Foreign-born white population, classified by divisions, 108; age, 118; country of birth, 128, 134; per cent living in urban communities, 108.
Foreign-born white prisoners, classified by literacy, 147, 148; country of birth, 334–338.
Foreign-born white prisoners and juvenile delinquents, classified by class of institution, 111, 330; offense, 112, 113, 123, 412, 415; sentence, 114–117, 454; age, 118, 119, 125, 349, 350; sex, 121–125, 132–136, 330, 349, 413, 414; country of birth, 128, 130, 334, 338, 415; individual institutions, 204; divisions and states, 320, 337; literacy, 485, 486; per cent of total prisoners and juvenile delinquents, 107; ratio to population, 129.
Foremen in stores and warehouses. *See* Floorwalkers, etc.
Foresters and lumbermen, offenses of which convicted, 489; per cent distribution, 150.
Forgery, commitments for, 28, 30, 164, 188; by class of institution, 31, 356; sentence, 64, 459; amount of fine, 67; age, 72, 74, 400; sex, 81, 356; race, 91, 92, 103; nativity, 112, 123; country of birth, 130; divisions and states, 360, 403; occupation, 489; relative gravity of offense, 66.
Fornication, commitments for, 29, 30, 164, 188; by class of institution, 31, 356; divisions and states, 37, 360; sentence, 64, 459; amount of fine, 67; age, 72, 74, 400; sex, 81, 356; relative gravity of offense, 66. *See also* Prostitution, etc.
France, white prisoners and juvenile delinquents born in, 128, 334, 339; ratio to population, 129; classified by offense, 130; sex, 132–136, 335, 336; divisions and states, 337; committed for nonpayment of fine, 338.
Fraud, commitments for, 28, 30, 164, 166, 188; by class of institution, 31, 356; sentence, 64, 459; amount of fine, 67; age, 72, 74, 400; sex, 81, 356; race, 91, 92, 103; nativity, 112, 123; country of birth, 130; divisions and states, 360, 403; occupation, 489; relative gravity of offense, 66.
Furniture workers, offenses of which convicted, 489; per cent distribution, 150.

Gainful offenses against property, commitments for, 28, 164, 188; by sentence, 64, 459; sex, 81, 356; class of institution, 356; divisions and states, 360; age, 400.
Gambling, commitments for, 29, 30, 164, 188; by class of institution, 31, 358; sentence, 65, 460; amount of fine, 67; age, 72, 74, 401; sex, 81, 358; divisions and states, 362; relative gravity of offense, 66.
Game laws, violation of. *See* Violating fish, etc., laws.
Gatemen (steam railway). *See* Flagmen, etc.
Germany, white prisoners and juvenile delinquents born in, 128, 334, 339; ratio to population, 129; classified by offense, 130; sex, 132–136, 335, 336; divisions and states, 337; committed for nonpayment of fine, 338.
Glassworkers, offenses of which convicted, 489; per cent distribution, 150.
Glaziers. *See* Painters, etc.

Harness makers, offenses of which convicted, 489.
Hat makers, offenses of which convicted, 489.
Homicide, grave and lesser, commitments for, 28, 30, 164, 188; by class of institution, 31, 356; sentence, 64, 459; amount of fine, 67; age, 72, 74, 400; sex, 81, 356; race, 91, 92, 103; nativity, 112, 123; country of birth, 130; divisions and states, 360, 403; occupation, 489; relative gravity of offense, 66.
Hostlers. *See* Drivers, etc.
Hotel and restaurant keepers, offenses of which convicted, 489; per cent distribution, 150.
Housekeepers and stewards, offenses of which convicted, 489, 490.
Hungary, white prisoners and juvenile delinquents born in, 128, 334, 339; ratio to population, 129; classified by offense, 130; sex, 132–136, 335, 336; divisions and states, 337; committed for nonpayment of fine, 338.

Illegal practice of profession, commitments for, 29; by sentence, 65, 459; sex, 81, 356; class of institution, 356; divisions and states, 360; age, 400.
Illegal sale of drugs. *See* Drugs.
Illiterate prisoners and juvenile delinquents, per cent in total population 10 years or over, 21; classified by divisions and states, 146; race and nativity, 147.
Immigration laws, violation of. *See* Violating immigration laws.

Imprisonment, prisoners and juvenile delinquents sentenced to, 41; by class of institution, 43, 314; divisions and states, 51, 57, 314; offense, 64, 384, 459; age, 76, 480; sex, 83, 326, 480, 481; race, 94, 326; nativity, 114, 326; marital condition, 141, 481; parentage, 326.
—— juvenile offenders sentenced to, 169, 182, 189.
Imprisonment and fine, prisoners and juvenile delinquents sentenced to, 41; by class of institution, 43, 314; divisions and states, 51, 314; amount of fine, 52, 53, 67, 466; offense, 67, 384, 466; sex, 83, 326, 480, 481; race, 83, 94, 326; nativity, 83, 114, 326; parentage, 83, 326; age, 480; marital condition, 481; per cent of total imprisonments, 46, 58.
Imprisonment for life, prisoners and juvenile delinquents sentenced to, 42; by divisions and states, 50, 427–439; offense, 64; age, 76; sex, 83; race, 94, 95; nativity, 116; comparison with previous censuses, 42; per cent of total imprisonments, 58.
—— juvenile offenders sentenced to, 170–173, 182, 184, 189, 190.
Imprisonment for nonpayment of fine, prisoners and juvenile delinquents sentenced to, 41; by class of institution, 43, 314; divisions and states, 57, 314; offense, 60, 392, 478; sex, 83; race, 94, 95, 487; nativity, 114, 115, 487; marital condition, 141; amount of fine, 448, 478; allowance per day on fine, 449; literacy, 487; per cent of total imprisonments, 46, 58.
—— juvenile offenders sentenced to, 169, 172, 182, 189.
Incest, commitments for, 29; by sentence, 64, 459; sex, 81, 356; class of institution, 356; divisions and states, 360; age, 400.
Incorrigibility, commitments for, 29, 30, 164, 188; by class of institution, 31, 358; sentence, 65, 460; age, 72, 74, 401; sex, 81, 358; divisions and states, 362.
Indian population, 87.
Indian prisoners and juvenile delinquents, 87, 89; classified by divisions and states, 320; age and sex, 349.
Injuries to common carriers, commitments for, 29, 30, 164, 188; by class of institution, 31, 356; sentence, 65, 459; age, 72, 74, 400; sex, 81, 356; divisions and states, 360; relative gravity of offense, 66.
Institutions, penal or reformatory, prisoners and juvenile delinquents committed to, classified by offense, 31, 356, 400, 421, 459, 466; sentence, 43, 44, 314, 384, 436, 459, 480; age, 71, 340, 343, 349, 350; sex, 79, 312, 320, 326, 349, 356, 480; race, 90, 320, 322, 326, 349, 350; nativity, 111, 320, 322, 326, 349, 350; divisions and states, 314; parentage, 320, 322, 326, 349, 350; country of birth, 334–336, 338; amount of fine, 442, 466; allowance per day on fine, 449; literacy, 484–487; summary of, by states, 204.
Institutions for juvenile delinquents, summary of, by states, 204.
Insurance agents, offenses of which convicted, 489.
